In the preparation of the various instruments of service contained herein, R.J. Burnside & Associates Limited was required to use and rely upon various sources of information (including but not limited to: reports, data, drawings, observations) produced by parties other than R.J. Burnside & Associates Limited. For its part R.J. Burnside & Associates Limited has proceeded based on the belief that the third party/parties in question produced this documentation using accepted industry standards and best practices and that all information was therefore accurate, correct and free of errors at the time of consultation. As such, the comments, recommendations and materials presented in this instrument of service reflect our best judgment in light of the information available at the time of preparation. R.J. Burnside & Associates Limited, its employees, affiliates and subcontractors accept no liability for inaccuracies or errors in the instruments of service provided to the client, arising from deficiencies in the aforementioned third party materials and documents.

R.J. Burnside & Associates Limited makes no warranties, either express or implied, of merchantability and fitness of the documents and other instruments of service for any purpose other than that specified by the contract.

1.0 Introduction

1.1 General Information

R.J. Burnside & Associates Limited (Burnside) has been retained by Devron Developments to prepare a Functional Servicing and Stormwater Management Report for the proposed redevelopment of 13-21 John Street, 36-40 South Station Street and part of 1919 Weston Road in the City of Toronto.

The subject site is approximately 0.38 ha and located southeast of the intersection of John Street and South Station Street. Refer to Figure 1 for the proposed site location. The four existing buildings on-site are to be demolished. The proposed redevelopment comprises of a 40-storey residential building with a podium including residential amenities, commercial retail space, and two levels of underground parking. The redevelopment will also include a private laneway which will connect to South Station Street and John Street and will provide access to the underground parking and loading bay.

This Functional Servicing and Stormwater Management Report (FSR) will support the Rezoning Application and future Site Plan Applications for the proposed redevelopment. The attached engineering designs and drawings related to site servicing and grading will incorporate the functional concepts outlined in this report.

1.2 Objectives

The objectives of this Functional Servicing and Stormwater Management Report are:

- To evaluate and confirm adequate supply and on-site distribution of municipal water to meet domestic and fire flow requirements.
- To evaluate and confirm capacity for sanitary servicing including:
  - Review of the pre- and post-development sanitary flow under the design and wet weather flow conditions.
- To evaluate the stormwater management opportunities and constraints including:
  - Review of the existing quality and quantity control facilities for the site.
  - Determine suitable methods for attenuation and treatment of stormwater runoff.
  - Demonstrate compliance of the proposed stormwater control measures with the City of Toronto's Wet Weather Flow Management Guidelines (WWFMG) for stormwater management criteria.

The above will be completed in accordance with accepted engineering practices and governing criteria from the approval agencies in support of the redevelopment applications.

Site lighting, traffic, and parking considerations are not part of the scope of this report and will be addressed by others.

2.0 Background

2.1 Existing Conditions

The subject site located at 13-21 John Street, 36-40 South Station Street, and 1919 Weston Road. It is bound by John Street to the west, South Station Street to the north, commercial and institutional buildings to the east and south. The subject site has an approximate area of 0.38 ha and is currently composed of four existing buildings and street-level parking areas. Refer to Figure 2 for the existing site condition. The existing buildings will be demolished prior to the proposed redevelopment of the site. The existing features currently occupying the site are outlined in Table 1.

Table 1: Existing Site Breakdown

Existing Site Component	Area
Existing Building	0.091 ha
Existing Parking Lot	0.289 ha
Total Area	**0.380 ha**

The existing properties are serviced via storm sewer, sanitary sewer and watermain connections within South Station Street, and the existing storm sewer, combined sewer and watermain connections within John Street. The existing infrastructure within the South Station Street and John Street Road Rights-of-Way (ROW) can be utilized for the proposed redevelopment.

2.2 Proposed Redevelopment

The proposed redevelopment at 13-21 John Street, 36-40 South Station Street and 1919 Weston Road will include the demolition of the four existing buildings on-site and the construction of a 40-storey residential building with a podium including residential amenities, commercial retail space, and two levels of underground parking. Refer to Table 2 for the proposed development components.

Table 2: Proposed Development Components

Site Component	Number of Floors
Tower	40
Podium	8
Parking	2

As part of the proposed redevelopment, a private laneway has been included to provide access to the underground parking levels and loading bay area. The laneway is located along the south of the site with an entrance on John Street and South Station Street. A lay-by area will be provided along the laneway as a drop-off zone.

A site breakdown of the proposed redevelopment is outlines in Table 3.

Table 3: Proposed Site Breakdown

Component	Area
Flat Roof	0.165 ha
Green Roof	0.052 ha
Hardscape	0.150 ha
Landscape	0.013 ha
Total	**0.380 ha**

Refer to Figure 3 and Figure 4 for the proposed ground level and rooftop site plans, respectively.

3.0 Water Supply and Distribution

3.1 Existing Water Infrastructure

The existing water infrastructure adjacent to the site includes:

- A 300 mm diameter watermain in the west side of John Street.
- A 300 mm diameter watermain in the south side of South Station Street.

A subsurface utility investigation completed by T2 Utility Engineers on September 29, 2022, confirms that the existing development is serviced via connections to the 300 mm diameter watermain within South Station Street and the 300 mm diameter watermain within John Street.

Refer to Figure 2 and Drawing S1 for the location of the existing watermains located near the proposed redevelopment. Refer to Appendix A for the CUMAP and existing plan and profiles obtained from the City of Toronto.

3.2 Proposed Water Infrastructure

The proposed residential tower has a height of 124.00 m. As per the Ontario Building Code (OBC) for buildings with more than 84 m in height, two fire services are required from two sources of public watermain. As such, two fire services will be provided for the proposed redevelopment to satisfy the OBC requirement.

The residential tower is proposed to be serviced via 200 mm diameter fire connection to the existing 300 mm diameter on the south side of South Station Street, and via 150 mm diameter domestic connection off the 200 mm diameter fire connection.

To satisfy OBC requirements, a secondary 200 mm diameter fire connection is proposed to the existing 300 mm diameter on the west side of John Street. An additional 150 mm diameter domestic connection off the 200 mm diameter fire connection is proposed to service the podium. Each 200 mm diameter fire connection will be equipped with a detector check assembly in the building and each 150 mm diameter domestic connection will be equipped with a water meter and backflow preventor in the building.

Fire protection will be provided utilizing the existing hydrants on nearby the site. One additional private hydrant has been proposed within the southwest portion site to ensure adequate hydrant coverage. The proposed buildings will be equipped with an adequately designed system conforming to NFPA 13 and other NFPA sprinkler standards.

Refer to Figure 5 and Drawing S1 for further details on the locations of the fire and domestic connection locations.

3.3 Proposed Water Demand

The proposed redevelopment will be designed in accordance with the Fire Underwriters Survey (FUS) and the fire calculations were designed as per the "Water Supply for Public Fire Protection, A Guide to Recommended Practice in Canada," dated 2020. The following assumptions were made for the fire flow calculations:

- The redevelopment will be non-combustible construction and fully protected (Minimum 1-hour rating) with a coefficient of 0.8.
- The largest floor area plus 25% of two adjoining floors have been considered.
- The buildings will contain limited combustible contents resulting in a 15% reduction.
- A reduction of 25% has been considered for all buildings to include an NFPA Sprinkler System.

As per the City of Toronto's Design Criteria for Sewers and Watermains (2nd Ed. 2021), an average consumption rate of 190 L/cap/day and a maximum hourly peaking factor of 2.5 were considered in the domestic flow calculation to determine the anticipated total fire flow value for the proposed redevelopment.

The fire flow calculation for the proposed redevelopment indicates that the domestic and fire flow requirements are 3,005 GPM (190 L/s). Refer to Appendix B for the fire flow calculations.

Hydrant flow testing was completed by L&D Waterworks Inc. on June 24, 2022, for two hydrants located near the subject site. The existing hydrants are located on the West side of John Street at Pantelis Kalamaris Lane, and on the south side of South Station Street at 40 South Station Street. The hydrant flow testing results indicated the following:

- A theoretical flow of 5,508 GPM at 20 psi within the 300 mm diameter watermain on the west side of John Street.
- A theoretical flow of 6,434 GPM at 20 psi within the 300 mm diameter watermain on the south side of South Station Street.

The fire flow calculation for the proposed redevelopment indicates that the domestic and fire flow requirements are 3,005 GPM. As such, the results of the hydrant flow testing confirm that the existing water infrastructure can support the proposed redevelopment and that no upgrades to the watermain are required. Refer to Appendix B for the hydrant flow testing results.

4.0 Stormwater Management Analysis

4.1 Design Criteria

The proposed redevelopment is located within the City of Toronto and must comply with the City of Toronto's Wet Weather Flow Management Guidelines (WWFMG). Therefore, stormwater management design criteria for the site are as follows:

- Post-development flows must not exceed the 2-year pre-development flows with a runoff coefficient of C=0.50 (100-year post-development flows controlled to 2-year pre-development levels).
- Water balance controls are to retain the 5 mm rain event through infiltration, evapotranspiration, or rainwater re-use.
- The proposed redevelopment ensures no increase in erosion or downstream flooding.
- Provide an enhanced level of stormwater quality treatment (80% TSS Removal).

4.2 Method of Analysis

The Modified Rational Method (MRM) was used to calculate runoff rates from all drainage catchments, to quantify the detention storage for all control measures, and to demonstrate the site's overall SWM compliance, as specified by the WWFMG. Intensity-Duration-Frequency curves from the City of Toronto were used to simulate rainfall data.

4.3 Existing Stormwater Infrastructure

The existing storm infrastructure adjacent to the site includes:

- A 375 mm diameter storm sewer traveling in a southeast direction in the center of South Station Street.
- A 200 mm to 250 mm diameter storm sewer traveling in a southwest direction in the west side of John Street.
- A 250 mm diameter combined sewer traveling in a southwest direction in the center of John Street.

The subject site has a total area of 0.38 ha and is currently composed of four existing buildings and street-level parking areas.

A subsurface utility investigation completed by T2 Utility Engineers on September 29, 2022, confirms that the existing development is serviced via connections to the 375 mm diameter storm sewer within South Station Street.

Based on the plan and profiles and topographical survey information, it has been determined that the majority of the site's drainage is contained within the site and a

minor amount of external drainage is expected to enter the site from adjacent properties to the east and south.

Under existing conditions, the overland flow route for the site is split with the east portion draining in a northerly direction towards South Station Street and the remaining west portion draining in a westerly direction towards John Street. This overland flow route is to be maintained through the redevelopment of the site to ensure no negative impacts to the existing drainage patterns. Refer to Figure 6 for the existing drainage conditions.

4.4 Allowable Release Rate

The pre-development peak flow rate for the site was modelled using the Modified Rational Method at a runoff coefficient of C=0.50 as per the Wet Weather Flow Management Guidelines.

The site area of 0.38 ha was considered to determine the 2-year pre-development runoff rate for the proposed redevelopment using a runoff coefficient of C=0.50. In accordance with the City of Toronto Design Criteria for Sewers and Watermains and the WWFMG, the 100-year post-development runoff rate for the site area must be controlled back to an allowable release rate equal to the 2-year pre-development runoff rate of 46.6 L/s.

Under existing conditions, the overland flow route across the subject site is divided with only the west portion draining to South Station Street. The 0.26 ha drainage area which outlets to South Station Street under the existing conditions has a 2-year pre-development flow of 57.4 L/s considering a runoff coefficient C=0.90. The allowable release rate of 46.6 L/s was selected as the maximum release rate for this redevelopment to ensure there are no negative impacts to the storm sewer downstream of the redevelopment.

Under existing conditions, there is an external drainage area which is conveyed through the proposed redevelopment. The allowable release rate for the proposed redevelopment has been adjusted to account for the external storm flow that is expected to enter the site. The 2-year pre-development runoff rate for this external area was calculated to be 2.4 L/s. The allowable release rate has been increased to account for this external runoff that will be conveyed through the site. As such, the allowable release rate from the subject site is 49.0 L/s (46.6 L/s + 2.4 L/s).

Refer to Figure 7 and Drawing S1 for details. Refer to Appendix C for stormwater calculations.

5.0 Proposed Stormwater Management

5.1 Stormwater Quantity Control

The proposed redevelopment has been designed with one drainage area which has an outlet to the existing storm sewer within South Station Street. The subject site has been designed to control the 100-year post-development flows to the 2-year pre-development flows and on-site storage has been provided accordingly.

There may be runoff from rainstorms that exceeds the capacity of the City's storm service connections. Therefore, the Owner shall be responsible to provide flood protection or a safe overland flow route for the proposed redevelopment without causing damage to the proposed and adjacent public and private properties.

Existing drainage patterns on adjacent properties shall not be altered and stormwater runoff from the subject redevelopment shall not be directed to drain onto adjacent properties.

The controlled flow for the site is proposed to outlet via 250 mm diameter storm sewer connection to the existing 375 mm diameter storm sewer within South Station Street at EX.STM-MH1.

Table 4 summarizes the stormwater quantity requirements to meet the allowable release rate for the site. Refer to Figure 7 for the proposed stormwater design.

Table 4: Release Rates and Storage Volumes

Area ID	Description	Area (ha)	Target Release Rate (L/s)	Actual Release Rate (L/s)	Active Storage Required (m^3)
DEV	Rooftop	0.17	49.0	38.1	122
	Green Roof	0.05			
	Hardscape	0.13			
	Landscape	0.01			
UNC	Uncontrolled Area	0.02		9.4	-
Total		**0.38**		**47.5**	**122**

To ensure that the outlet to the proposed storm sewer system discharges at or below the target release rate, the use of an outlet orifice control is necessary. The orifice that releases at a rate nearest the target release rate of 39.3 L/s (49.0 L/s - 9.4 L/s) is a 125 mm DR11 orifice with an inner diameter of 114.07 mm with a release rate of 38.1 L/s. The orifice will be placed upstream of the control manhole to control the flow to the South Station Street storm sewer.

The proposed stormwater storage tank will be located in the P1 level and is proposed to be pumped due to shallow depth of the tank outlet. The required active storage volume is 122.0 m^3. The required storage volume is based on an actual release rate of 38.1 L/s; should the release rate be controlled to less than 38.1 L/s, the required storage will be greater than 122.0 m^3.

Refer to Appendix C for the stormwater calculations, Figure 7, Drawing S1, and Drawing G1 for further details.

5.2 Stormwater Retention (Water Balance)

As per the City of Toronto Wet Weather Flow Management Guidelines, it is required that the 5 mm rainfall event be retained on-site through infiltration, evapotranspiration, or rainwater reuse.

The full site area of 0.38 ha has been considered in determining the minimum rainfall re-use volume to meet both the quality and water balance requirements for the proposed redevelopment. The following method has been considered in determining the minimum rainfall re-use volume:

Minimum Rainfall Re-Use = Site Area (m^2) x 5 mm

Minimum Rainfall Re-Use = (3,801) x (0.005) = 19.01 m^3

The initial abstraction for the subject site considers the proposed roof, green roof, hardscape, and landscape areas. These abstracted volumes are presented in Table 5.

Table 5: Initial Abstraction

Surface	Initial Abstraction (m)	Area (m^2)	Initial Abstraction Volume (m^3)
Impervious Roof	0.001	1677	1.7
Green Roof	0.005	518	2.6
Impervious Areas	0.001	1478	1.5
Pervious Areas	0.005	127	0.6
	Total	**3801**	**6.4**

The following method has been used to determine the minimum rainfall re-use volume following initial abstraction:

Minimum Rainfall Re-Use = Site Area (m^2) x 5 mm – IA

Minimum Rainfall Re-Use = 19.01 m^3 - 6.4 m^3 = 12.6 m^3

To achieve the water balance criteria, the required retention and reuse for the proposed site area of 0.38 ha is 12.6 m^3.

Dead storage will be provided within the stormwater storage tank to store and re-use the stormwater on-site. The proposed stormwater system will be designed to re-use the stormwater for irrigation (rainwater harvesting) on-site. Should the irrigation methods be insufficient to re-use the full volume of stormwater, alternative water re-use methods will be considered such as grey-water toilets within the podium. This will be determined at the detailed design stage and Site Plan Approval.

Refer to Appendix C for the stormwater calculations.

5.3 Stormwater Quality Control

As per the City of Toronto's Wet Weather Flow Management Guidelines and the Ministry of the Environment Stormwater Management Planning and Design Manual (March 2003), stormwater quality control is required for the site to achieve a TSS removal efficiency of 80%. Refer to Table 6 below.

Table 6: Effective TSS Removal Rate

Surface	Effective TSS Removal (%)	Treated Area (m^2)	% of Total Area	TSS Removal Over Total Site
Impervious Roof	80%	1,677	44.1%	35.3%
Green Roof	80%	518	13.6%	10.9%
Hardscape	0%	1,478	38.9%	0.0%
Landscape	80%	127	3.4%	2.7%
	Total	**3,801**	**100%**	**48.9%**

To achieve a TSS Removal Rate of 80%, a treatment train approach will be required. The first step of the treatment train is to re-use the stormwater retention on-site for irrigation; 50% of the stormwater is considered to be treated for 80% TSS removal when re-used for irrigation. The TSS removal rate of the site after irrigation is 69.33%; please refer to the calculations below.

R = A + B - ([A x B] / 100)
R = Total TSS Removal Rate
A = TSS Removal Rate of First BMP
B = TSS Removal Rate of Second BMP

TSS Removal Rate = 48.9% + (50% x 80%) - [(48.9% x 50% x 80%) / 100)]
TSS Removal Rate = 69.33%

As per the City of Toronto Wet Weather Flow Management Guidelines, OGS devices operating at their original design capacities, are capable of achieving a maximum TSS removal of 50%.

To achieve a TSS removal of 80% for the subject site, an OGS unit will be provided upstream of the outlet at the control manhole to treat the stormwater in a treatment train approach. Refer to the calculation below.

R = A + B - ([A x B] / 100)
R = Total TSS Removal Rate

A = TSS Removal Rate of First BMP
B = TSS Removal Rate of Second BMP

TSS Removal = 69.33% + 50% - [(69.33% x 50%) / 100)]
TSS Removal = 84.67%

The TSS removal for the subject site after treatment with the OGS unit is 84.67% which exceeds the 80% TSS removal target. Refer to Appendix C for details.

6.0 Groundwater Management

A Hydrogeological Assessment Report is required at the Rezoning Application and Site Plan Application stages to determine the anticipated post-development and temporary construction flow rates and quality of the groundwater. If groundwater is proposed to be discharged to a municipal sewer in the short-term, the Property Owner is required to enter into a Sewer Discharge Agreement with Toronto Water, Environmental Monitoring and Protection for the temporary discharge of groundwater into a Municipal combined, storm, or sanitary sewer, and is required to submit a Groundwater Discharge Application to Toronto Water, Environmental Monitoring and Protection and obtain short-term discharge approval as per Toronto Municipal Code Chapter 681.

A Hydrogeological Assessment Report was completed by EXP Services Inc., dated September 13, 2022, refer to Appendix D.

6.1 Permanent Private Water Drainage System (PWDS)

Based on the City of Toronto Foundation Drainage Policy which came into effect January 1, 2022, long-term discharge of foundation drainage to the City's sanitary sewer system will not be permitted. Long-term discharge of foundation drainage that contains any groundwater will not be permitted to the City's storm or combined sewer system. As such, the proposed substructure must be designed to be fully waterproofed without the need for a Private Water Drainage System (PWDS), and there will be no groundwater discharge from the redevelopment permitted to the municipal sewer system.

6.2 Short-Term Construction Dewatering

Groundwater will need to be managed during the construction phase either by discharging to the sewer, for which a Short-Term Construction Discharge Agreement with the City would be required, or by hauling water from the site.

The proposed redevelopment will include the demolition of the existing buildings on the site and the construction of a residential tower with a podium including residential amenities, commercial retail spaces, and two levels of underground parking.

A steady state dewatering requirement was estimated for the proposed redevelopment at 135,000 L/day of total volume with a Safety Factor of 2 (excluding precipitation). As dewatering flow rates can be significantly higher during and after precipitation events, a potential maximum dewatering requirement was also estimated to be 185,000 L/day of total volume with a Safety Factor of 2 (including precipitation). If the total dewatering rate exceeds 400,000 L/day, a Permit to Take Water (PTTW) will be required from the Ministry of Environment, Conservation and Parks (MECP) under the Ontario Water Resources Act. If the total dewatering rate is between 50,000 to 400,000 L/day, the water taking must be registered with the Environmental Activity and Sector Registry

(EASR), and if the total dewatering rate is less than 50,000 L/day, a permit is not required. While 185,000 L/day is the rate which will be required to be discharged to the municipal sewer system, the construction dewatering rate excluding the precipitation amount is the rate used for permit application. As 135,000 L/day is within the 50,000 to 400,000 L/day range, the water taking for this development will be registered with the EASR, but a PTTW is not required.

Discharge of groundwater to the sewer is subject to provisions of the Sewer Use By-Law, provided that the quality limits for discharging groundwater into the sanitary sewers satisfy the limits listed in Table 1 of Chapter 681, and the quality limits for discharging of groundwater into the storm sewers satisfy the limits as listed in Table 2 of Chapter 681. Groundwater chemistry sampling will be undertaken to determine if any samples exhibit exceedances of City of Toronto Storm/Sanitary Sewer Use By-Law criteria limits. If they do, additional groundwater sampling and testing will be undertaken to confirm the observed exceedances and determine the appropriate treatment options to facilitate short-term groundwater discharge to the municipal sewer system.

From preliminary sampling undertaken, it is anticipated that TSS levels and other parameters in the pumped groundwater may become elevated and exceed both the Sanitary and Storm Sewer Use By-Law limits. A suitable treatment method will be implemented to discharge to the applicable sewer system.

7.0 Sanitary Servicing

7.1 Existing Sanitary Servicing

The existing sanitary infrastructure adjacent to the site includes:

- A 200 mm to 250 mm diameter combined sewer travelling in a southwest direction in the center of John Street.
- A 250 mm diameter sanitary sewer travelling in a southeast direction in the center of South Station Street.

Refer to Figure 6 and Drawing S1 for the location of the existing sanitary sewer and combined sewer.

7.2 Existing Sanitary Sewer Flow

A subsurface utility investigation completed by T2 Utility Engineers on September 29, 2022, confirms that the existing development at 13-21 John Street contributes to the combined sewer within John Street and the existing development at 36-40 South Station Street contributes to the sanitary sewer within South Station Street.

An equivalent population was calculated to determine the existing sanitary flow using the City of Toronto's Design Criteria for Sewer and Watermains (2nd Ed., 2021). The existing theoretical flow from the existing buildings, including an infiltration allowance, was calculated to be 0.15 L/s to the John Street combined sewer and 0.39 L/s to the South Station Street sanitary sewer.

Refer to Appendix E for the existing sanitary sewer calculations.

7.3 Proposed Sanitary Servicing

An equivalent population was calculated to determine the proposed sanitary flow using population densities for residential units and commercial areas per the City of Toronto's Design Criteria for Sewer and Watermains (2nd Ed., 2021).

The residential sanitary flow for the proposed redevelopment was calculated using the following:

- Domestic sewage flow based upon a unit sewage flow of 240 L/cap/day for residential uses with a peaking factor (2.00<PF>4.00).
- Infiltration rate of 0.26 L/s/ha.

The commercial flows were calculated using the maximum of:

- Domestic sewage flows based upon an average flow of 180,000 L/floor ha/day for commercial uses (PF=1).

- Domestic sewage flows based upon a unit sewage flow of 250 L/cap/day for commercial uses with a peaking factor (PF=1).

Using these domestic sewage flows, the proposed sanitary contribution to the South Station Street sewer was calculated to be 9.76 L/s, including an infiltration allowance. The proposed redevelopment will result in a 9.37 L/s (9.70 L/s - 0.39 L/s) increase in sanitary flow contributing to the sanitary sewer system within South Station Street. The proposed sanitary flow will be conveyed via two new 250 mm diameter sanitary connections to the existing 250 mm diameter sanitary sewer in South Station Street. As the proposed redevelopment is causing an increase in flow to the existing sanitary sewer system, a downstream sewer analysis has been completed to confirm that there are no negative impacts to the existing sewer system. Refer to Section 8.0 for further details.

Refer to Figure 5 and Drawing S1 for further details regarding the proposed connection locations. Refer to Appendix E for the proposed sanitary calculations.

8.0 Downstream Sanitary Analysis

The subject site at 13-21 John Street and 36-40 South Station Street is located within Study Area 51 of the City of Toronto Basement Flooding Protection Program Map. The Basement Flooding Environmental Assessment for Study Area 51 began in 2019, as such, no InfoWorks model for the Study Area is available at this time.

A sanitary sewer analysis was completed to confirm if the existing sewer network to the downstream sanitary trunk has sufficient capacity to service the proposed redevelopment. The sanitary sewer network for this study starts at South Station Street and runs through Lawrence Avenue West where it connects to the existing 750 mm diameter trunk sewer at Humber River, southwest of Lawrence Avenue West and Hickory Tree Road.

As per Toronto Water's Sewer Capacity Assessment Criteria, analyses have been completed under the design flow and extreme wet weather flow conditions to determine the capacity constraints of the sanitary sewer system downstream of the proposed redevelopment to the trunk sewer located at Humber River, southwest of Lawrence Avenue West and Hickory Tree Road.

This preliminary downstream capacity analysis reviews the capacity of the municipal sewer system from the proposed redevelopment to the existing 750 mm diameter trunk sewer at Humber River, southwest of Lawrence Avenue West and Hickory Tree Road.

As per Toronto Water's Sewer Capacity Assessment Criteria, sufficient sanitary flow is defined such that:

- Under the dry weather flow scenario, the flow shall be less than the full pipe flow capacity meaning there is no surcharge in any section of the pipe.
- Under the wet weather flow scenario, the modelled hydraulic grade line (HGL) of the flow must be at least 1.8 m below the ground surface.

As per Toronto Water's Sewer Assessment Criteria, this analysis has been completed under the dry weather and wet weather flow conditions to determine the capacity constraints of the sanitary sewer system downstream of the proposed redevelopment.

8.1 Downstream Sanitary Sewer Capacity Analysis Assumptions and Considerations

As the InfoWorks model for Study Area 51 has not yet been completed; design sheets were used to complete the analysis. The assumptions made to complete the analysis include:

- Existing plan and profiles were used to determine the existing invert, pipe sizes, and manhole top elevations for the analysis:
  - Note: The existing plan and profiles provided by the City of Toronto (prepared in 1955, 1967, and 1992) did not align with one another and had inverts which yielded up to 0.5 m differences.
  - At the time of writing this report, an underground utility investigation is underway for the subject site and surrounding roads; further connection information will be provided in a future submission.
- The City of Toronto's Design Criteria was used to establish theoretical population flows generated within the Drainage Areas. GIS imagery and City of Toronto Zoning Maps were used to determine existing land-usage.
- Average per capita flow rates of 240 L/capita/day for residential population considering Harmon peaking factor, and 250 L/capita/day were applied for Industrial, Commercial, and Institutional (ICI) populations to determine contributing flow.
- Furthermore, the average flow rate of 180,000 L/floor ha/d was calculated for ICI contributing areas and compared to the flows generated by population to determine the maximum flow rate.
- The hydraulic gradeline (HGL) for this analysis was established to be the obvert of the downstream sanitary sewer at the trunk.
- Recent development application updates to the existing conditions were considered using information publicly available from the City of Toronto Development Applications Website.

The preliminary downstream sanitary sewer capacity analysis was completed taking the above noted assumptions into consideration from the proposed redevelopment at 13-21 John Street and 36-40 South Station Street to the 750 mm diameter trunk sewer at Humber River. At the time of writing this report, flow monitoring data has not been received from the City of Toronto. Once that data is available, the downstream capacity analysis will be updated accordingly.

8.2 Existing Conditions Model

The sanitary flows contributing to the trunk sewer were analyzed using two scenarios based on the design (dry weather) and extreme wet weather flows for the pre-development conditions:

- Design (Dry Weather) Conditions (I/I = 0.26 L/s/ha).
- Extreme Wet Weather Conditions (I/I = 3.0 L/s/ha).

The following assumptions were made:

- The existing trunk sewer has sufficient capacity for the existing flows.
- The HGL connection to the trunk sewer has been set to the obvert of the connecting pipe.

The existing sanitary sewer capacity and hydraulic grade line elevations were examined from the proposed redevelopment to the trunk sewer. The results of the analysis are below.

8.2.1 Scenario 1: Pre-Development Sanitary Flow – Design Conditions (Dry Weather)

As per the Existing Condition Sanitary Sewer Design Sheet for dry weather, no downstream sewer has a pipe capacity exceeding 100%; as such, no pipe is surcharged.

8.2.2 Scenario 2: Pre-Development Sanitary Flow – Extreme Wet Weather

As per the Existing Condition Sanitary Sewer Design Sheet for Extreme Wet Weather, there are three segments of sewer downstream of the subject site that have an HGL elevation less than 1.8 m from the surface. Refer to Table 7.

Table 7: Scenario 2 – Pre-Development

From	To	Diameter (mm)	Slope	Depth to HGL US (m)	Depth to HGL DS (m)
MH10A	MH11A	300	2.20%	1.91	1.44
MH11A	MH12A	450	0.38%	1.44	1.71
MH12A	MH13A	450	38.70%	1.71	2.82

Refer to Appendix E and Figure 8 for details.

8.3 Existing Conditions + Recent Developments Model

To ensure that the downstream sanitary capacity analysis reflects the existing conditions today, the City of Toronto's Development Application Website was used to identify recent developments within the sewershed. The recent developments added to the existing condition can be found in Table 8 below.

Table 8: Recent Developments

Site Address	Land Use Type	Description
2278 Weston Road	Residential	Proposed additional two units to existing 33-unit residential development.
2270-2274 Weston Road	Residential	Proposed 12-storey apartment building with 107 units.
2179 Weston Road	Residential	Proposed three 4-storey townhouses and nine single-family units.
64 King Street	Residential	Proposed dividing one single-family lot into two single-family lots.
1956 Weston Road	Mixed-Use	Proposed two 29-storey residential towers and podium with a total of 592 residential units and commercial retail.

The developments listed above were added to the existing condition. Refer to Figure 9 and Appendix E for further details on the recent developments added to the analysis.

The sanitary sewers contributing to the trunk sewer were analyzed using two scenarios based on the design (dry weather) and extreme wet weather flows for the existing conditions plus recent developments model.

- Design (Dry Weather) Conditions (I/I = 0.26 L/s/ha).
- Extreme Wet Weather Conditions (I/I = 3.0 L/s/ha).

The following assumptions were made:

- The existing trunk sewer has sufficient capacity for the proposed flows.
- The HGL connection to the trunk sewer has been set to the obvert of the connecting pipe.

The proposed sanitary sewer capacity and hydraulic grade line elevations were examined from the proposed redevelopment to the trunk sewer. The results of the analysis are below.

8.3.1 Scenario 3: Existing Conditions + Recent Developments Sanitary Flow – Design Conditions (Dry Weather)

As per the Existing Condition + Recent Developments Sanitary Sewer Design Sheet for dry weather, no downstream sewer has a pipe capacity exceeding 100%; as such, no pipe is surcharged.

8.3.2 Scenario 4: Existing Conditions + Recent Developments Sanitary Flow – Extreme Wet Weather

As per the Existing Condition + Recent Development Sanitary Sewer Design Sheet for Extreme Wet Weather, there are three segments of sewer downstream of the subject site that have an HGL elevation less than 1.8 m from the surface. Refer to Table 9 below.

Table 9: Scenario 4 – Pre-Development + Recent Developments

From	To	Diameter (mm)	Slope	Depth to HGL US (m)	Depth to HGL DS (m)
MH10A	MH11A	300	2.20%	1.91	1.42
MH11A	MH12A	450	0.38%	1.42	1.71
MH12A	MH13A	450	38.70%	1.71	2.82

Refer to Appendix E and Figure 9 for details.

8.4 Post-Development Sanitary Sewer Analysis

The sanitary sewers contributing to the trunk sewer were analyzed using two scenarios based on the design (dry weather) and extreme wet weather flows for the post-redevelopment conditions:

- Design (Dry Weather) Conditions (I/I = 0.26 L/s/ha).
- Extreme Wet Weather Conditions (I/I = 3.0 L/s/ha).

The following assumptions were made:

- The existing trunk sewer has sufficient capacity for the proposed flows.
- The HGL connection to the trunk sewer has been set to the obvert of the connecting pipe.

The proposed sanitary sewer capacity and hydraulic grade line elevations were examined from the proposed redevelopment to the trunk sewer. The results of the analysis are below.

8.4.1 Scenario 5: Post-Development Sanitary Flow – Design Conditions (Dry Weather)

As per the Proposed Condition Sanitary Sewer Design Sheet for dry weather, no downstream sewer has a pipe capacity exceeding 100%; as such, no pipe is surcharged.

8.4.2 Scenario 6: Post-Development Sanitary Flow – Extreme Wet Weather

As per the Post-Development Condition Sanitary Sewer Design Sheet for Extreme Wet Weather, there are three segments of sewer downstream of the subject site that have an HGL elevation less than 1.8 m from the surface. Refer to Table 10 below.

Table 10: Scenario 6 – Post-Development

From	To	Diameter (mm)	Slope	Depth to HGL US (m)	Depth to HGL DS (m)
MH10A	MH11A	300	2.20%	1.91	1.42
MH11A	MH12A	450	0.38%	1.42	1.71
MH12A	MH13A	450	38.70%	1.71	2.82

As the additional 9.37 L/s of sanitary flow from the proposed redevelopment does not cause any increases to the existing HGL, it will not cause any negative impacts to the existing sanitary sewer system.

Refer to Appendix F and Figure 10 for details.

9.0 Erosion and Sediment Control

The Erosion and Sediment Control Plan for the site will be designed in conformance with the City of Toronto Guidelines. The erosion and sediment control strategy will include the following:

- Temporary sediment control fence at construction limits and/or downstream of any disturbed areas prior to grading.
- Gravel mud mats at construction vehicle access points to minimize off-site tracking of any sediments.
- Sediment traps in existing and proposed catch basins.
- Routine inspections, monitoring, and repair as necessary of all erosion and sediment control measures during construction.
- Removal of temporary controls once the areas they serve are restored and stable.

All reasonable measures will be taken to ensure that sediment loading is minimized both during and following construction. Refer to Drawing ESC1 (Erosion and Sediment Control Plan) for further details.

10.0 Conclusions and Recommendations

The servicing analysis provided above is summarized as follows:

10.1 Water Servicing

- Two connections to existing watermain will be provided to service the proposed redevelopment: one combined fire and domestic connection to the existing 300 mm diameter watermain within South Station Street, and one combined fire and domestic connection to the existing 300 mm diameter watermain within John Street.
- Fire protection will be accommodated through the use of existing hydrants within the John Street and South Station Street ROW, and one proposed private hydrant within the site.
- The proposed redevelopment will be equipped with an adequately designed system conforming to NFP 13 and other NFPA sprinkler standards.
- Hydrant flow testing completed adjacent to the site in June 2022, can confirm that the existing water infrastructure can support the proposed redevelopment and that no upgrades to the existing watermain infrastructure are required.

10.2 Stormwater Management

- The site will control the 100-year flows to the pre-development 2-year flows at a runoff coefficient of 0.50 as per the WWFMG.
- Quantity control will be achieved through the use of an orifice control downstream of the proposed stormwater storage tank.
- Quality control will be achieved using a treatment train approach and the implementation of an oil and grit separator (OGS). An enhanced TSS removal of 80% will be achieved on-site.
- Water balance will be achieved by retaining the 5 mm storm event and the stormwater tank will be design for stormwater re-use. Re-use methods will be confirmed at the time of Site Plan Application.

10.3 Groundwater Management

- The proposed substructure must be designed to the fully waterproofed without the need for a Private Water Drainage System (PWDS), and there will be no long-term groundwater discharge from the redevelopment to the municipal sewer system.
- Groundwater and rainwater totaling 185,000 L/day will be managed during the construction period either through hauling water from the site or discharge to the sewer. An EASR will be required to facilitate the construction dewatering program.
- As it is anticipated that TSS levels and some other parameters exceed the limits of the Sanitary and Storm Sewer Use By-law limits, suitable treatment methods will be implemented to discharge to the applicable sewer system.

10.4 Sanitary Servicing

- Sanitary drainage from the proposed redevelopment will be conveyed via two connections to the existing 250 mm diameter sanitary sewer within South Station Street.
- The proposed redevelopment will generate an increase in peak sanitary flows of 9.37 L/s (9.76 L/s - 0.39 L/s), from the existing condition.

10.5 Downstream Sanitary Analysis

- A downstream analysis was completed for the subject site based on the information received to date and can confirm that the proposed increase in sanitary flow will not cause a negative impact to the existing sewer system.

In summary, further subsurface utility investigations and flow monitoring will be required to confirm if the site can be serviced by the surrounding municipal infrastructure.

Accordingly, upon receipt and review of the above noted additional information, we hereby recommend the adoption of this report as it relates to the provision of servicing and stormwater management works, and for the purposes of this Rezoning Application and future Site Plan Applications.

KEY PLAN

NOT TO SCALE

GENERAL NOTES

1. T2UE'S SUE FIELD INVESTIGATION WAS PERFORMED AUGUST 2022. CHANGES TO UTILITIES THAT OCCURRED FOLLOWING OUR INVESTIGATION MAY NOT BE SHOWN. CONSIDERATION SHOULD BE GIVEN TO UPDATING THIS PLAN PRIOR TO FINAL DESIGN AND CONSTRUCTION.

2. LIMIT OF INVESTIGATION:

- RIGHT OF WAYS FRONTING 13-21 JOHN STREET AND 36-40 SOUTH STATION STREET – AS SHOWN ON DRAWING.

3. FIELD VERIFICATION OF UTILITIES WAS COMPLETED USING A COMBINATION OF ELECTROMAGNETIC PIPE AND CABLE LOCATE EQUIPMENT.

4. EMPTY CONDUITS, SERVICES, LATERALS TO BUILDINGS, ABANDONED FACILITIES SUCH AS STREET LIGHT CABLES, WITHIN THE INVESTIGATION AREA MAY NOT BE SHOWN ON THE DRAWING.

5. T2UE USED AVAILABLE MEANS IN AN ATTEMPT TO DETERMINE THE LOCATION OF UNDOCUMENTED UTILITIES HOWEVER CANNOT BE RESPONSIBLE FOR FINDING ALL UNDOCUMENTED UTILITIES.

6. THE BASEPLAN WAS PROVIDED BY THE CLIENT, THEREFORE T2UE IS NOT RESPONSIBLE FOR ITS ACCURACY.

7. UTILITY OWNERSHIP, MATERIAL, SIZES AND FLOW SHOWN ON DRAWING ARE BASED ON RECORDS INFORMATION RECEIVED, FIELD INVESTIGATION AND PROFESSIONAL JUDGEMENT.

8. UTILITY WIDTHS ON DRAWING ARE BASED ON RECORDS RECEIVED.

9. PIPE OFFSETS ARE SHOWN WHERE THE CENTER OF THE PIPE IS OFFSET FROM CENTER OF THE CHAMBER LID BASED ON RECORDS OR VISUAL VERIFICATION. DISTANCE SHOWN IS APPROXIMATE AND DIRECTION IS NOTED FROM THE CENTER OF THE LID.

10. PLANT SHOWN AS "ABANDONED (ABND)" ON THE DRAWINGS ARE BASED ON RECORD INFORMATION PROVIDED. STATUS OF THE UTILITY SHOULD TO BE CONFIRMED WITH THE UTILITY OWNER.

11. SEE PROJECT REPORT FOR ADDITIONAL INFORMATION.

ASCE QUALITY LEVELS

THE UTILITY INFORMATION SHOWN ON THIS DRAWING WAS COLLECTED IN ACCORDANCE TO ASCE STANDARD 38-02. THE INFORMATION IS SHOWN BY QUALITY LEVEL WHICH INDICATES THE LEVEL OF EFFORT USED TO DETERMINE THE LOCATION OF THE DATA

INCREASED QUALITY

QUALITY LEVEL "D" – INFORMATION DERIVED FROM EXISTING RECORDS OR VERBAL RECOLLECTIONS.

QUALITY LEVEL "C" – INFORMATION OBTAINED BY SURVEYING AND PLOTTING VISIBLE ABOVE GROUND UTILITY FEATURES AND BY USING PROFESSIONAL JUDGEMENT IN CORRELATING THIS INFORMATION TO THE QUALITY LEVEL "D" INFORMATION.

QUALITY LEVEL "B" – INFORMATION OBTAINED THROUGH THE APPLICATION OF APPROPRIATE SURFACE GEOPHYSICAL METHODS TO DETERMINE THE EXISTENCE AND APPROXIMATE HORIZONTAL POSITION OF THE UTILITIES.

QUALITY LEVEL "A" – PRECISE HORIZONTAL AND VERTICAL LOCATION OF UTILITES OBTAINED BY THE ACTUAL EXPOSURE AND SUBSEQUENT MEASUREMENT OF SUBSURFACE UTILITIES.

CALCULATION SHEET

Project: **John Street and South Station Street**

Domestic and Fire Flow Calculations

Prepared by:	HH
Checked by:	JS
Project No:	300054203
Date:	September 27, 2022

Based on Fire Underwriters Survey

1 F= 220 C (sqrt (A))

Where F= Fire flow in Lpm
C= construction type coefficient
= 0.8 Type II Noncombustible Construction
A = total floor area in sq.m. excluding basements, includes garage

Floor	Area (sq.m)	%
4	1,719	100%
3	1,719	25%
5	1,556	25%

Largest Area= 2,537 sq.m
F = 8,866 L/min

Round to nearest 1000 l/min
F = 9,000 Ll/min

2 Occupancy Reduction
15% reduction for normal residential occupancy
Reduction = 1350 L/min
F = 7,650 L/min

3 Separation Charge — Update with new site plan in CAD

15%	North Side	10.1m to 20m
20%	East Side	3.1m to 10m
20%	South Side	3.1m to 10m
15%	West Side	10.1m to 20m
70%	Total Separation Charge,	**5355** L/min

Note: Maximum Total Separation Charge is 75%

4 Sprinkler Reduction
25% Reduction for NFPA Sprinkler System
Reduction = **1913** L/min

5 Domestic Flow Calculations

Population = 879 persons
Ave. Day Demand = 190 L/cap/day
116 L/min
Max. Hourly Peaking Factor = 2.5
Max. Domestic Flow Rate F_{dom} = **290** L/min

F = 13,005 - 1913 + 290 = 11,382 l/min
F = 190 L/s
F = 3005 GPM

1 Introduction

1.1 Project Description

EXP Services Inc. (EXP) was retained by 21 John Dev Inc.. to prepare a Hydrogeological Investigation Report associated with the proposed development located at 13, 15, 17, 19, & 21 John Street and 36, 38, & 40 South Station Street, Toronto, Ontario (hereinafter referred to as the 'Site').

It is our understanding that the proposed development plan is to demolish the existing structures and construct a thirty-eight (38) storey mixed-use building with two (2) levels of underground parking (P2). The architectural drawings are provided in Appendix H. The Site location plan is shown on Figure 1.

EXP conducted a Geotechnical Investigation in conjunction with this investigation. The pertinent information gathered from the noted investigation is utilized for this report.

1.2 Project Objectives

The main objectives of the Hydrogeological Investigation are as follows:

- Establish the local hydrogeological settings within the Site;
- Provide recommendations on construction (short--term) and post-construction (long-term) dewatering;
- Assess groundwater quality; and
- Prepare a Hydrogeological Investigation Report.

1.3 Scope of Work

To achieve the investigation objectives, EXP has completed the following scope of work:

- Reviewed available geological and hydrogeological information for the Site;
- Developed and conducted Single Well Response Tests (SWRT) on all five (5) monitoring wells installed in geotechnical boreholes during the geotechnical drilling program to assess hydraulic conductivities of the saturated soils at the Site;
- Completed six (6) rounds of groundwater level measurements at all monitoring wells. As per the City of Toronto's requirements, a three (3)-month monitoring program is currently in progress.
- Collected two (2) groundwater samples for analyses of parameters, as listed in the City of Toronto Sanitary and Storm Sewer Use By-Law;
- Evaluated the information collected during the field investigation program, including borehole geological information, Water Well Records (WWR), SWRT results, groundwater level measurements and groundwater water quality;
- Prepared site plans, cross sections, geological mapping and groundwater contour mapping for the Site;
- Estimated construction (short-term) and post-construction (long-term) dewatering flow rates;
- Provided recommendations on the Ministry of Environment, Conservation and Parks (MECP) Water Taking Permits and City of Toronto Sewer Discharge Agreements (SDA) for the construction and post-construction phases;
- Prepared a Hydrogeological Investigation Report; and
- As per the City's requirements, Hydrology Review Form is completed under a separate cover.

The Hydrogeological Investigation was prepared in accordance with the Ontario Water Resources Act, Ontario Regulation 387/04, and Toronto Municipal Code 681-Sewers. The scope of work outlined above was made to assess dewatering and did not include a review of Environmental Site Assessments (ESA).

Any past and/or future geotechnical, hydrogeological, environmental and risk assessments, and updated development/architectural plans should be provided to update this hydrogeological report prior to submission of permits and approvals by the municipalities and agencies.

1.4 Review of Previous Documents

The following documents were reviewed as part of this Hydrogeological Investigation:

- EXP Services Inc. (September 9, 2022), Supplementary Geotechnical Investigation, Proposed Multi-Storey Mixed-Use Development 13, 15, 17, 19 and 21 John Street and 36, 38 and 40 South Station Street, Toronto, Ontario, prepared for 21 John Dev Inc.
- 3XN USA LLC (July 22, 2022), Draft Architectural Drawings, South Station Street, 13-21 John Street / 30-40 South Station Street, Toronto, ON, prepared for Devron.
- EXP Services Inc. (December 9, 2021), Preliminary Geotechnical Investigation, Proposed Multi-Storey Mixed-Use Development 13, 15, 17, 19 and 21 John Street and 36, 38 and 40 South Station Street, Toronto, Ontario, prepared for Devron Developments.

Any past and/or future geotechnical, hydrogeological, environmental and risk assessments, and updated development/architectural plans should be provided to update this hydrogeological report prior to submission of permits and approvals by the municipalities and agencies.

2 Hydrogeological Setting

2.1 Regional Setting

2.1.1 Regional Physiography

The Site is within a physiographic region known as the Iroquois Plain. The physiographic landform is named Sand Plains. The South Slope lies to the north of the Iroquois Plain (Chapman & Putnam, 2007).

The Iroquois Plain was created along the shores of former Lake Iroquois, an ancient glacial lake. The noted Plain primarily consists of shallow water sandy deposits.

The topography of the Iroquois Plain is relatively flat with a gradual slope to the south, toward Lake Ontario.

2.1.2 Regional Geology and Hydrogeology

The surficial geology can be described as coarse textured (foreshore-basinal) glaciolacustrine deposits consisting of sand, gravel, minor silt and clay (Ministry of Northern Development and Mines, 2012). The surficial geology of the Site and surrounding areas is shown on Figure 2.

Based on the available regional geology maps, the subsurface stratigraphy of the Site from top to bottom is summarized in Table 2-1 (TRCA, 2008 and Oak Ridge Moraine Groundwater Program, 2022). The overburden thickness is approximately between 7 and 9 meters (Appendix G).

Table 2-1: Summary of Subsurface Stratigraphy

Stratigraphic Unit	General Description	Top Elevation of Stratigraphic Unit (masl)
Oak Ridges Moraine or Equivalent (Aquifer)	This geology unit mainly consists of interbedded fine-grained sand and silt deposits where coarse-grained sand and gravel along with clay laminae are locally reported.	127
Thorncliffe Formation (Aquifer)	This geology formation generally consists of glaciofluvial (sand, silty sand) or glaciolacustrine deposits (silt, sand, pebbly silt and clay).	126
Sunnybrook Formation (Aquitard)	This lithologic unit was deposited near an ice sheet. It predominately consists of silt and clay.	120
Georgian Bay Formation	Bedrock primarily consists of interbedded shale, limestone, dolostone and siltstone. It belongs to the Upper Ordovician, (Ministry of Northern Development and Mines, 2012).	119

Regional groundwater across the area flows south-southeast, towards Humber River and Lake Ontario, respectively (Oak Ridge Moraine Groundwater Program, 2022). Local deviation from the regional groundwater flow pattern may occur in response to changes in topography and/or soils, as well as the presence of surface water features and/or existing subsurface infrastructure.

2.1.3 Existing Water Well Survey

Water Well Records (WWRs) were compiled from the database maintained by the Ministry of the Environment, Conservation and Parks (MECP) and reviewed to determine the number of water wells documented within a 500-m radius of the Site centroid. The locations of the MECP WWRs within 500 m of the Site centroid are shown on Figure 3. A summary of the WWR is included in Appendix A.

The MECP WWR database indicates ninety-seven (97) offsite records (Figure 3 and Appendix A). Well distances are calculated relative to the Site centroid, therefore some distances exceed 500 m.

The database indicates that the offsite wells are at an approximate distance of forty-three (43) m or greater from the Site centroid. All offsite wells are reportedly identified as monitoring and observation wells, test holes, abandoned and/or listed with unknown use. The reported water levels ranged from depths of 0.4 m to 11.5 meters below ground surface (mbgs).

2.2 Site Setting

2.2.1 Site Topography

The Site is in an commercial land use setting. The topography is considered relatively flat with a regional gradual southerly slope towards Humber River.

As indicated on the borehole logs included in Appendix B, the surface elevation of the Site ranges between approximately 126.66 to 127.40 meters above sea level (masl).

2.2.2 Local Surface Water Features

The Site is within the Black Creek - Humber River Outlet watershed. No surface water features exist onsite. The nearest surface water feature is Humber River, approximately located 350 meters southwest of the Site boundary. Lake Ontario is approximately 8.5 km from the Site boundary to the southeast (Appendix G).

Based on the Toronto Region and Conservation Authority floodplain database, the Site is not within the floodplain areas (Appendix G).

2.2.3 Local Geology and Hydrogeology

A summary of subsurface soil stratigraphy is provided in the following paragraphs. The soil descriptions are based on the geotechnical investigation report (EXP, 2021 and 2022). They are summarized for the hydrogeological interpretations. As such, the information provided in this section shall not be used for construction design purposes.

The detailed soil profiles encountered in each borehole and the results of moisture content determinations are presented on the attached borehole logs (Appendix B). The interpreted geological cross-section is shown on Figure 5. The soil boundaries indicated on the borehole logs are inferred from non-continuous sampling and observations during drilling. These boundaries are intended to reflect approximate transition zones for the Hydrogeological Investigation and shall not be interpreted as exact planes of geological change.

The "Notes on Sample Description" preceding the borehole logs form an integral part of the logs and should be read in conjunction with this report. The following is a brief description of the soil conditions encountered during the investigation.

Based on the results of the geotechnical investigation, the general subsurface soil stratigraphy consists of the following units from top to bottom:

Pavement Structure

According to the EXP's geotechnical report issued in 2021, pavement structure comprising asphalt with thickness ranging from about 75 to 115 mm underlain by granular fill 150 to 300 mm in thickness was encountered at Borehole 1, 2, 3, 6 and 7 locations.

According to the EXP's geotechnical report issued in 2022, pavement structure comprising asphalt with thickness ranging from about 50 to 75 mm underlain by granular fill 75 to 175 mm in thickness was encountered at Borehole 201, 202 and 203.

Fill

According to the EXP's geotechnical report issued in 2021, fill was encountered at the surface of Borehole 4 and 5 locations and below the pavement structure in all other borehole locations. The fill extends to depths ranging from about 1.5 to 3 m below existing ground surface. The fill comprises a mix of clayey silt, silty clay, sandy silt and silty sand, with traces of gravel. Moisture contents in the fill ranged from approximately 4 to 24 percent. The samples were described to be in moist to very moist condition.

According to the EXP's geotechnical report issued in 2022, fill was encountered at the surface of Borehole 204 and 205 locations and below the pavement structure in all other borehole locations. The fill extends to depths ranging from about 1.5 to 2.3 m below existing ground surface. The fill comprises a mix of clayey silt, silty clay, sandy silt and silty sand, with traces of gravel. Moisture contents in the fill ranged from approximately 3 to 23 percent. The samples were described to be in moist to very moist condition.

Silty Clay

According to the EXP's geotechnical report issued in 2021, a silty clay deposit was encountered below the fill in Borehole 1, 2, 3, 5, 6 and 7 locations. The deposit was encountered at approximate depths of 1.5 to 2.3 m, and extended to depths of about 2.3 to 4.5 m. This deposit contains trace sand and gravel. It is brown in colour and has moisture contents of about 18 to 25 percent of dry mass indicating very moist condition. The silty clay has a firm to stiff consistency (recorded 'N'-values of 8 to 14).

Silty Clay Till

According to the EXP's geotechnical report issued in 2021, silty clay till was encountered below the silty clay in Boreholes 1, 2 and 3 and below the fill in Borehole 4. The silty clay till was encountered at approximate depths of 2.3 to 3 m and extends to depths of about 4 to 4.5 m below existing ground surface. This deposit contains some sand and trace gravel and is brown in colour. It has moisture contents of 13 to 18 percent of dry mass indicating moist condition. The silty clay till has a stiff to very stiff consistency (recorded 'N'-values of 12 to 17).

According to the EXP's geotechnical report issued in 2022, a silty clay deposit was encountered below the fill in all borehole locations. The deposit was encountered at approximate depths of 1.5 to 2.3 m and extended to depths of about 3.8 to 5.2m. This deposit contains trace sand and gravel. It is brown in colour, changing to grey with depth and has moisture contents of about 11 to 26 percent of dry mass indicating moist to very moist condition. The silty clay has a firm to firm to very stiff consistency (recorded 'N'-values of 8 to 28).

Shale Bedrock

According to the EXP's geotechnical report issued in 2021, shale bedrock was encountered below the silty clay till in Boreholes 1, 2, 3, and 4 and below the silty clay in Boreholes 5, 6, and 7. All boreholes were terminated by auger refusal in the shale bedrock. Highly weathered shale was encountered at approximate depths of about 4 to 4.5 m. The recorded 'N'-values in the shale were 50 blows for less than 150 mm of penetration.

According to the EXP's geotechnical report issued in 2022, shale bedrock was encountered below the silty clay till in all borehole locations. Highly weathered shale was encountered at approximate depths of about 3.8 to 5.3 m. The recorded 'N'-values in the shale were 50 blows for less than 150 mm of penetration. Upon encountering auger refusal, rock coring was initiated to verify bedrock conditions. The coring was carried out using 'H' sized double tube wireline equipment. The boreholes were terminated in the shale bedrock at depths ranging from about 15.1 to 15.5 m. The shale contains 71 to 84% shale, 3 to 8% limestone, 9 to 16% siltstone, and 0 to 1% clay seams.

3 Results

3.1 Monitoring Well Details

The monitoring well network was installed as part of the Geotechnical and Environmental Investigations at the Site. It consists of the following:

- Seven (7) shallow monitoring wells, including BH1 through BH 7 were installed to an approximate depth ranged from 3.8 mbgs to 5.8 mbgs;
- Five (5) deep monitoring wells, including BH201 through BH205 were installed to an approximate depth ranged from 15.1 mbgs to 15.4 mbgs.
- Each monitoring well is equipped with a 50-mm (2-inch) diameter PVC casing, a flush-mount, and a three (3)-meter long screen.

Borehole logs and monitoring well installation details are provided in Appendix B. The monitoring well locations are shown on Figure 4.

3.2 Water Level Monitoring

As part of the Hydrogeological Investigation, static water levels were recorded in six (6) monitoring events between November 30, 2021, and August 18, 2022. A summary of all static water level data as it relates to the elevation survey is given in Appendix C. As per the City's requirements, a three (3)-month monitoring program is currently in progress. This hydrogeological assessment report will be updated upon the completion of the noted program.

The groundwater elevation recorded for the shallow wells ranged from 124.78 masl (2.23 mbgs at BH 7 on January 18, 2022) to 125.84 masl (1.48 at BH 4 on November 30, 2021).

The groundwater elevation recorded for the deep wells ranged from 115.65 masl (11.30 mbgs at BH205 on August 4, 2022) to 117.77 masl (9.63 mbgs at BH201 on July 29, 2022).

Two (2) maps were created for the Site to show groundwater contours in the shallow and deep water-bearing zones (Figures 6A and 6B, respectively). Accordingly, the groundwater flow direction is interpreted to be south of the Site, towards Humber River.

The groundwater monitoring data obtained from the Site indicates that vertical groundwater gradient at the Site is downward. However, based on the ORMGP's database mapping, the vertical groundwater gradient is shown upward (Appendix G).

Groundwater levels are expected to show seasonal fluctuations and vary in response to prevailing climate conditions. This may also affect the direction and rate of flow. It is recommended to conduct seasonal groundwater level measurements to provide more information on seasonal groundwater level fluctuations.

3.3 Hydraulic Conductivity Testing

Twelve (12) Single Well Response Tests (SWRT's) were completed on all monitoring wells on December 3, 2021, as well as August 4 and 18, 2022. The tests were completed to estimate the saturated hydraulic conductivity (K) of the lithologic units at the well screen depths. Water level in each well was recorded both manually and electronically. A pre-programmed data-logger was utilized to record the water displacements in one (1) second interval electronically.

The static water level within each monitoring well was measured prior to the start of testing. In advance of performing SWRTs, each monitoring well underwent development to remove fines introduced into the screens following construction. The

development process involved purging of the monitoring wells to induce the flow of fresh formation water through the screen. Each monitoring well was permitted to fully recover prior to performing SWRTs.

Hydraulic conductivity values were calculated from the SWRT and constant rate test data as per Hvorslev's solution included in the Aqtesolv Pro. V.4.5 software package. The semi-log plots for normalized drawdown versus time are included in Appendix D. A summary of the hydraulic conductivities (K-values) estimated from the SWRTs are provided in Tables 3-1 and 3-2 below.

Table 3-1: Summary of Hydraulic Conductivity Test Results for Shallow Water-Bearing Zone

Monitoring Well	Well Depth (mbgs)*	Screen Interval (mbgs)*		Screened Lithology**	Estimated Hydraulic Conductivity (m/s)
		from	to		
BH 1	4.53	1.53	4.53	Fill (Clayey Silt/Silty Clay), Silty Clay/Silty Clay Till	7.7E-08
BH 2	4.34	1.34	4.34	Silty Clay / Silty Clay Till/ Weathered Shale	5.7E-07
BH 3	4.39	1.39	4.39	Fill (Silty Clay)/Silty Clay/Silty Clay Till/Weathered Shale	5.2E-07
BH 4	3.77	0.77	3.77	Fill (Silty Sand/Silty Clay)/Silty Clay Till/Weathered Shale	2.6E-06
BH 5	4.40	1.40	4.40	Silty Clay/Weathered Shale	2.8E-06
BH 6	5.80	2.80	5.80	Silty Clay/Weathered Shale	3.6E-06
BH 7	5.26	2.26	5.26	Silty Clay/Weathered Shale	1.5E-06
Highest Estimated K-Value for Overburden and Weathered Bedrock					3.6E-06
Arithmetic Mean of K-Values for Overburden and Weathered Bedrock					1.7E-06
Geometric Mean of Estimated K-Values for Overburden and Weathered Bedrock					9.8E-07

Table 3-2: Summary of Hydraulic Conductivity Test Results for Deep Water-Bearing Zone (Sound Bedrock)

Monitoring Well	Well Depth (mbgs)*	Screen Interval (mbgs)*		Screened Lithology**	Estimated Hydraulic Conductivity (m/s)
		from	to		
BH201	15.43	12.43	15.43	Shale	2.4E-08
BH202	15.13	12.13	15.13	Shale	9.1E-08
BH203	15.27	12.27	15.27	Shale	3.5E-07
BH204	15.43	12.43	15.43	Shale	1.8E-08
BH205	15.34	12.34	15.34	Shale	7.4E-09
Highest Estimated K-Value for Sound Bedrock					3.5E-07
Arithmetic Mean of K-Values for Sound Bedrock					9.8E-08
Geometric Mean of Estimated K-Values for Sound Bedrock					4.0E-08

Notes:
mbgs: meters below ground surface
*based on field measurements
**based on the geotechnical borehole logs (EXP, 20121 and 2022)

SWRTs provide K-estimates of the geological formation surrounding the well screens and may not be representative of bulk formation hydraulic conductivity. As shown on Table 3-1, the highest K-value of the tested shallow water-bearing zone (saturated overburden and weathered bedrock) is 3.6E-6 m/s. The geometric and arithmetic means of the K-values for the same zone are 9.8E-7 m/s and 1.7E-6 m/s, respectively. As shown on Table 3-2, the highest K-value for the tested deep water-bearing zone (saturated sound bedrock) is 3.5e-7 m/s. The geometric and arithmetic means of K-value for the same zone are

4E-8 m/s and 9.8E-8 m/s, respectively. Considering the approximate thicknesses of shallow and deep water-bearing zones as well as the arithmetic K-values for the noted zones, the weighted K-value is estimated 7.3E-7 m/s.

3.4 Groundwater Quality

To assess the suitability for discharging pumped groundwater into the sewers owned by the City of Toronto during dewatering activities, two (2) groundwater samples were collected from monitoring wells BH 7 on November 30, 2021, and BH 203 on August 4, 2022, using a peristaltic pump. Prior to collecting the noted water samples, approximately three (3) standing well volumes of groundwater were purged from the referred well. The samples were collected unfiltered and placed into pre-cleaned laboratory-supplied vials and/or bottles provided with analytical test group specific preservatives, as required. Dedicated nitrile gloves were used during sample handling. The groundwater samples were submitted for analysis to Bureau Veritas Laboratory, a CALA certified independent laboratory in Mississauga, Ontario. Analytical results are provided in Appendix E. Table 3-3 summarizes exceedance(s) of the Sanitary (Table 1) and Storm (Table 2) Sewer Use By-Law parameters.

When comparing the chemistry of the collected groundwater samples to the City of Toronto Sanitary and Combined Sewer Discharge Criteria (Table 1), there were no parameter exceedances to be reported.

When comparing the chemistry of the collected groundwater samples to the City of Toronto Storm Sewer Discharge Criteria (Table 2), the concentrations of Total Suspended Solids (TSS) and Total Manganese (Mn) exceeded the applicable guidelines.

Reporting detection limits (RDLs) were below the Sewer Use By-Law parameter criteria of Tables 1 and 2.

Table 3-3: Summary of Analytical Results

Parameter	Units	City of Toronto Sanitary and Combined Sewer Discharge Limit (Table 1)	City of Toronto Storm Sewer Discharge Limit (Table 2)	Concentration	
				BH 7 November 30, 2021	BH 203 August 4, 2022
Total Suspended Solids (TSS)	mg/L	350	15	**46**	**29**
Total Manganese (Mn)	µg/L	5,000	50	**1,640**	**52**

Notes:
Bold – Exceeds City of Toronto Storm Sewer Discharge Limit (Table 2).

For the short-term dewatering system (construction phase), it is anticipated that TSS levels and some other parameters (for example, Total Metals) in the pumped groundwater become elevated and exceed both Sanitary and Storm Sewer Use By-Law limits. To control the concentration of TSS and associated metals, it is recommended that a suitable treatment method be implemented (filtration or decantation facilities and/ or any other applicable treatment system) during construction dewatering activities prior to discharging to the applicable sewer system. The specifications of the treatment system will need to be adjusted to the reported water quality results by the treatment contractor/process engineer.

An agreement to discharge into the sewers owned by the City of Toronto will be required prior to releasing dewatering effluent.

4 Dewatering Assessment

The dimensions of the proposed structure to support the dewatering assessment are summarized in Table 4-1 below.

Table 4-1 Building Dimensions for Dewatering Assessment

Input Parameter	Assumption	Units	Notes
Number of Subgrade Levels	2 Levels (P2)	-	
Ground Surface Elevation	127.4	masl	Highest ground surface elevation at the Site (EXP, 2021 and 2022)
Top of Slab Elevation	121.4	masl	Based on the architectural drawings, the top of slab is anticipated to be six (6) meters below ground surface (Appendix H).
Lowest Footing Elevation	119.7	masl	The lowest foundation elevation as per the geotechnical report (EXP, 2022)
Excavation Area (Length x Width)	~ 3,335 (78 x 43)	m^2 (m x m)	Approximate area (length x width) of Site for the proposed development (Assumed)

4.1 Dewatering Flow Rate Estimate and Zone of Influence

The Dupuit-Forcheimer equation for radial flow to both sides of an excavation through an unconfined aquifer resting on a horizontal impervious surface was used to obtain a flow rate estimate. Dewatering flow rate is expressed as follows:

$$Q_w = \frac{\pi K(H^2 - h^2)}{Ln\left[\frac{R_o}{r_e}\right]}$$

$$r_e = \frac{a+b}{\pi} \qquad R_o = R_{cj} + r_e$$

Where:

Qw = Rate of pumping (m^3/s)
X = Length of excavation (m)
K = Hydraulic conductivity (m/s)
H = Hydraulic head beyond the influence of pumping (static groundwater elevation) (m)
h = Hydraulic head above the base of aquifer in an excavation (m)
R_0 = Radius of influence (m)
R_{cj} = Cooper-Jacob's radius of influence (m)
r_e = Equivalent perimeter (m)
a = Length of the excavation area (m)
b = Width of the excavation area (m)

It is expected that the initial dewatering rate will be higher to remove groundwater from within the overburden formation. The dewatering rates are expected to decrease once the target water level is achieved in the excavation footprint as groundwater will have been removed, primarily from storage, resulting in lower seepage rates into the excavation.

4.2 Cooper-Jacob's Radius of Influence

The radius of influence (Rcj) for the construction dewatering was calculated based on Cooper-Jacob's equation. This equation is used to predict the distance at which the drawdown resulting from pumping is negligible.

The estimated radius of influence due to pumping is based on Cooper-Jacob's formula as follows:

$$R_{cj} = \sqrt{2.25KDt/s}$$

Where:

Ro = Estimated radius of influence (m)
D = Aquifer thickness (original saturated thickness) (m)
K = Hydraulic conductivity (m/s)
S = Storage coefficient
t = Duration of pumping (s)

4.3 Stormwater

Additional pumping capacity may be required to maintain dry conditions within the excavation during and following significant precipitation events. Therefore, the dewatering rates at the Site should also include removing stormwater from the excavation.

A 15 mm precipitation event was utilized for estimating the stormwater volume. The calculation of the stormwater volume is included in Appendix E.

The estimate of the stormwater volume only accounts for direct precipitation into the excavation. The dimensions of the excavation are considered in the dewatering calculations. Runoff which originated outside of the excavation's footprint is excluded and it should be directed away from the excavation.

During precipitation events greater than 15 mm (ex: 100-year storm), measures should be taken by the contractor to retain stormwater onsite in a safe manner to not exceed the allowable water taking and discharge limits, as necessary. A two (2) and a one hundred (100) year storm event over a 24-hour period are 57.0 and 124.4 mm, which would produce 191 m^3 and 417 m^3 stormwater volume (refer to Appendix F).

4.4 Results of Dewatering Rate Estimates

4.4.1 Construction Dewatering Rate Estimate

For this assessment, it was assumed that the proposed construction plans include an excavation with shoring extending to the Site boundaries. EXP should be retained to review the assumptions outlined in this section, should the assumed shoring design change. Short-term (construction) dewatering calculations are presented in Appendix F.

Pits (elevator, sump pits) are assumed to have the same excavation depth and dewatering target as the main excavation; deeper pits may require localized dewatering and revised dewatering estimates.

Based on the assumptions provided in this report, the results of the dewatering rate estimate can be summarized as follows:

Table 4-2 Summary of Construction Dewatering Rate

Dewatering Estimates	
Description	**With Two (2) Levels of Underground Parking (L/day)**
Total Volume (L/day) Short Term Discharge of Groundwater (Construction dewatering) without Safety Factor (including precipitation)	118,000
Total Volume (L/day) Short Term Discharge of Groundwater (Construction dewatering) with Safety Factor of 2 (including precipitation)	185,000
Total Volume (L/day) Short Term Discharge of Groundwater (construction dewatering) with Safety Factor of 2 (excluding Precipitation) for EASR	135,000

The peak dewatering flow rates does not account for flow from utility beddings and variations in hydrogeological properties beyond those encountered during this investigation.

Local dewatering may be required for pits (elevator pits, sump pits), if these extend deeper than the dewatering target. Local dewatering is not considered to be part of this assessment. Dewatering estimates should be reviewed once the pit dimensions are available.

Local dewatering may be required for pits (elevator pits, sump pits, raft) and for localized areas with permeable, soft, or wet soil conditions. Local dewatering is not considered to be part of this assessment, but contractor should be ready to install additional system to manage such conditions. Dewatering estimates should be reviewed once the pit dimensions are available.

All grading around the perimeter of the excavation should be graded away from the shoring the systems and ramp/site access to redirect runoff away from excavation.

The dewatering assumptions are based on using shoring system without open cuts and sloped excavations.

If groundwater cutoff systems (ex: caisson walls, sheet piles) are installed, these should be designed for maximal hydrostatic pressure for shallow and deep water levels, without dewatering on the outer side of the groundwater cutoff. Soldier pile and lagging and caisson wall systems should be designed to account for shallow groundwater conditions and take into consideration that dewatering systems may not provide fully dewatered soil conditions.

All grading around the perimeter of the construction Site should be graded away from the shoring the system.

The contractor is responsible for the design of the dewatering systems (depth of wells, screen length, number of wells, spacing sand pack around screens, prevent soil loss etc.) to ensure that dry conditions are always maintained within the excavation at all costs.

Dewatering should be monitored using dedicated monitoring wells within and around the perimeter of the excavation, and these wells should be monitored using manual measurements and with electronic data loggers; records should be maintained

on site to track dewatering progress. Discharge rates should be monitored using calibrated flow meters and records of dewatering progress, and daily precipitation as per MECP requirements should be maintained.

4.4.2 Post-Construction Dewatering Rate Estimate

It is our understanding that the development plan includes a permanent foundation sub-drain system that will ultimately discharge to the municipal sewer system if conventional footings are installed.

As of January 1, 2022, the foundation drainage policy from the City of Toronto prohibits post construction discharge of groundwater into the municipal sewer system.

The long-term dewatering was based on the same equations as construction dewatering shown in Section 4.1. The calculation for the estimated flow to the future sub-drain system (with no cutoff walls) is provided in Appendix F. The dewatering target for the foundation drainage system is taken at 0.5 m below the lowest slab elevation.

The foundation drain analysis provides a flow rate estimate. Once the foundation drain is built, actual flow rate measurements of the sump discharge will be required to confirm the estimated flow rate.

Based on the assumptions provided in this report, the estimated sub-drain discharge volumes are summarized in Appendix F. Seasonal and daily fluctuations are expected. These estimates may be affected by hydrogeological conditions beyond those encountered at this time, fluctuations in groundwater regimes, surrounding Site alterations, and existing and future infrastructures.

Table 4-3: Summary of Long-Term Dewatering Rate

Long-Term Dewatering Flow Rate	Two (2) Levels of Underground Parking (L/day)
Total Volume (L/day) Long-Term Drainage of groundwater (from foundation drainage, weeping tiles, sub slab drainage) with Safety Factor of 1.5	35,000
Long-Term Dewatering Rate without Safety Factor	24,000

Intermittent cycling of sump pumps and seasonal fluctuation in groundwater regimes should be considered for pump specifications. A safety factor was applied to the flow rate to account for water level fluctuations due to seasonal changes.

These estimates assume that pits (elevator and/or sump pits) are made as watertight structures (without drainage), if their depths extend below the dewatering target, as previously stated. The dewatering assumptions are based on using shoring system without open cuts. Open cuts can act as preferential groundwater pathways in the long-term and cause foundation drainage volumes to increase.

The sub-drain rate estimate is based on the assumptions outlined in this report. Any variations in hydrogeological conditions beyond those encountered as part of this investigation may significantly influence the sub-drain discharge volumes.

4.5 MECP Water Taking Permits

4.5.1 Short-Term Discharge Rate (Construction Phase)

In accordance with the Ontario Water Resources Act, if the water taking for the construction dewatering is more than 50,000 L/day but less than 400,000 L/day, then an online registration in the Environmental Activity and Sector Registry (EASR) with the MECP will be required. If groundwater dewatering rates onsite exceed 400,000 L/day, a Category 3 Permit to Take Water (PTTW) will be required from the MECP.

As of July 1, 2021, an amendment of O. Reg. 63/16 has come into effect and replaced the former subsection 7 (5) such that the EASR water taking limit of 400,000 L/day would apply to groundwater takings of each dewatered work area only, excluding stormwater.

The dewatering estimate including a safety factor is greater than 50,000 L/day and less than 400, 000 L/day as shown in Table 4-2. The MECP construction dewatering rate excludes the precipitation amount and is the rate used for the permit application. Based on the MECP construction dewatering an EASR will be required to facilitate the construction dewatering program of the Site.

A Discharge Plan (dewatering sketch, sewer discharge agreement) must be developed and applied for any discharges from the Site. Monitoring of both water quantity and water quality must be carried out for the entire duration of the construction dewatering phase. During this phase, the Discharge Plan and the daily water taking records must be available onsite.

The EASR, Discharge Plan, hydrogeological investigation report, and geotechnical assessment of settlements must also be available at the construction Site during the entire construction dewatering. EXP should be notified immediately about any changes to the construction dewatering schedule or design, since the EASR will need to be updated to reflect these modifications. Altogether, the hydrogeological report, EASR, Discharge Plan and geotechnical assessment constitute the Water Taking Plan which needs to be available onsite during the construction dewatering.

4.5.2 Long-Term Discharge Rate (Post Construction Phase)

In accordance with the Ontario Water Resources Act, if the water taking for the construction dewatering is more than 50,000 L/day, then an application for a Category 3 Permit to Take Water (PTTW) will be required from the MECP.

Based on the dewatering estimate shown in Table 4-3 less than 50,000 L/day, permit to take water will not be required for the post-construction phase.

The safety factor for construction (short-term) dewatering is selected larger than for long-term to account for anticipated greater groundwater volumes during initial dewatering. The applied analytical formula is adequate for long-term (steady state) conditions as it omits specific yield and time dependency. When the formula is used for short-term conditions a larger safety factor is recommended to cover a larger initial dewatering rate, which is required to remove stored groundwater. Moreover, a large initial construction dewatering rate is favorable, as it supports reducing the time to reach the dewatering target elevation.

5 Environmental Impact

5.1 Surface Water Features

The Site is within the Black Creek - Humber River Outlet watershed. No surface water features exist onsite. The nearest surface water feature is Humber River, approximately located 350 meters southwest of the Site boundary. Lake Ontario is approximately 8.5 km from the Site boundary to the southeast (Appendix G).

Based on the Toronto Region and Conservation Authority floodplain database, the Site is not within the floodplain areas (Appendix G).

Due to the limited extent of zone of influence and the wide distance to the nearest surface water feature, no detrimental impacts on surface water features are expected during construction activities.

5.2 Groundwater Sources

Well Records from the MECP Water Well Record (WWR) Database were reviewed to determine the presence and number of water supply wells within a 500 m radius of the Site boundaries. Given that the dewatering zone of influence is limited, no dewatering related impact is expected on the water wells in the area.

5.3 Geotechnical Considerations

As per the MECP technical requirement for PTTW and EASRs, the geotechnical assessment of the stability of the soils due to water taking (ex: settlement, soil loss, subsidence, etc.) is required. The water taking should not have unacceptable interference on soils and underground structures (foundations, utilities, etc.).

A letter related to geotechnical issues as it pertains to the Site is required to be completed under a separate cover.

5.4 Groundwater Quality

It is our understanding that the potential effluent from the dewatering system during the construction will be released to the municipal sewer system. As such, the quality of groundwater discharge is required to conform the City of Toronto Sewer Use By-Law.

Dewatering may induce migration of contaminants within the zone of influence and beyond due to changing hydraulic gradients, hydrogeological conditions beyond Site boundaries and preferential pathways in utility beddings etc. The water quality sampling conducted as part of this assessment was performed under static conditions. As a result, monitoring may be required during dewatering activities to monitor potential migration, and this should be performed more frequently during early dewatering stages.

For the Short-term (construction) discharge to the Sanitary/Storm sewer system (post-development phase) and based on the water quality results, it is recommended to implement a suitable pre-treatment, as required.

For the long-term (post construction) dewatering discharge to the storm sewer system (post-development phase) and based on the water quality results, it is recommended to implement a suitable pre-treatment, as required.

The water quality results presented in this report may not be representative of the long-term condition of groundwater quality onsite. As such, regular water quality monitoring is recommended for the post-construction phase as required by the City.

The water quality results presented in this report may not be representative of the long-term condition of groundwater quality onsite. As such, regular water quality monitoring is recommended for the post-construction phase as required by the City.

An agreement to discharge into the sewers owned by the City of Toronto will be required prior to releasing dewatering effluent.

5.5 Well Decommissioning

In conformance with Regulation 903 of the Ontario Water Resources Act, the installation and eventual decommissioning of any dewatering system wells or monitoring wells must be completed by a licensed well contractor. This will be required for all wells that are no longer in use.

6 Conclusions and Recommendations

Based on the findings of the Hydrogeological Investigation, the following conclusions and recommendations are provided:

- When comparing the chemistry of the collected groundwater samples to the City of Toronto Sanitary and Combined Sewer Discharge Criteria (Table 1), there were no parameter exceedances to be reported.
- When comparing the chemistry of the collected groundwater samples to the City of Toronto Storm Sewer Discharge Criteria (Table 2), the concentrations of Total Suspended Solids (TSS) and Total Manganese (Mn) exceeded the applicable guidelines..
- A three (3) month monitoring program is currently in progress. This report will be updated upon the completion of the noted program.
- Based on the assumptions outlined in this report, the estimated peak dewatering rate for proposed construction activities is approximately 185,000 L/day. This is the rate which will be required to be discharged to the municipal sewer system.
- The estimated MECP dewatering rate for proposed construction activities is approximately 135,000 L/day. As the dewatering flow rate estimate is between 50,000 L/day and 400,000 L/day, an EASR will be required to facilitate the construction dewatering program for the Site.
- The estimated MECP dewatering rate for proposed post-construction activities is approximately 35,000 L/day. As the dewatering flow rate estimate is less than 50,000 L/day, permit to take water will not be required for the post-construction phase.
- The construction dewatering discharge volume is based on the assumptions outlined in this report. Any variations in hydrogeological conditions beyond those encountered as part of this preliminary investigation may significantly influence the discharge volume.
- For the short-term dewatering system (construction phase), it is anticipated that TSS levels and some other parameters (for example, Total Metals) in the pumped groundwater may become elevated and exceed both, Sanitary and Storm Sewer Use By-Law limits. To control the concentration of TSS and associated metals, it is recommended that a suitable treatment method be implemented (filtration or decantation facilities and/ or any other applicable treatment system) during construction dewatering activities to discharge to the applicable sewer system. The specifications of the treatment system will need to be adjusted to the reported water quality results by the treatment contractor/process engineer.
- As per the MECP technical requirement for EASR, the geotechnical assessment of the stability of the soils due to water taking (ex: settlement, soil loss, subsidence etc.) is required. The water taking should not have unacceptable interference on soils and underground structures (foundations, utilities etc.). A letter related to geotechnical issues as it pertains to the Site is required to be completed under a separate cover.
- An agreement to discharge into the sewers owned by the City of Toronto will be required prior to releasing dewatering effluent.
- The EASR registration allows construction dewatering discharge of up to 400,000 L/day. A Discharge Plan (dewatering sketch, sewer discharge agreement) must be developed and applied for any discharges from the Site. The Discharge Plan and monitoring for both water quantity and water quality must be carried at the Site during the entire construction dewatering phase. The daily water taking records must be maintained onsite for the entire construction dewatering phase. The EASR, Discharge Plan, hydrogeological investigation report, and geotechnical assessment of settlements must always also be available at the construction Site for the entire construction dewatering. EXP should be notified immediately about any changes to the construction dewatering schedule or design, since EASR will need to be updated to reflect these modifications. The hydrogeological report, EASR, Discharge Plan and geotechnical assessment constitutes the Water Taking Plan which needs to be available onsite for the duration of construction dewatering.

- In conformance with Regulation 903 of the Ontario Water Resources Act, the installation and eventual decommissioning of any dewatering system wells or monitoring wells must be completed by a licensed well contractor. This will be required for all wells that are no longer in use.

The conclusions and recommendations provided above should be reviewed in conjunction with the entirety of the report. They assume that the present design concept described throughout the report will proceed to construction. This report is solely intended for the construction and long-term dewatering assessments. Any changes to the design concept may result in a modification to the recommendations provided in this report.

7 Limitations

This report is based on a limited investigation designed to provide information to support an assessment of the current hydrogeological conditions within the study area. The conclusions and recommendations presented within this report reflect Site conditions existing at the time of the assessment. EXP must be contacted immediately, if any unforeseen Site conditions are experienced during construction activities. This will allow EXP to review the new findings and provide appropriate recommendations to allow the construction to proceed in a timely and cost-effective manner.

Our undertaking at EXP, therefore, is to perform our work within limits prescribed by our clients, with the usual thoroughness and competence of the geoscience/engineering profession. No other warranty or representation, either expressed or implied, is included or intended in this report.

This report was prepared for the exclusive use of 21 John Dev Inc. This report may not be reproduced in whole or in part, without the prior written consent of EXP, or used or relied upon in whole or in part by other parties for any purposes whatsoever. Any use which a third party makes of this report, or any part thereof, or any reliance on or decisions to be made based on it, are the responsibility of such third parties. EXP Services Inc. accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions based on this report.

We trust that this information is satisfactory for your purposes. Should you have any questions or comments, please do not hesitate to contact this office.

Sincerely,

EXP Services Inc.

Appendix B – Borehole Logs

Log of Borehole 1

Project No. Brm-21021990-A0

Drawing No. 2

Project: Geotechnical Investigation

Sheet No. 1 of 1

Location: 13 John Street

Date Drilled: November 4, 2021

Drill Type: Hollow Auger Truck

Datum: Geodetic

Auger Sample
SPT (N) Value
Dynamic Cone Test
Shelby Tube
Field Vane Test (S)

Combustible Vapour Reading
Natural Moisture
Plastic and Liquid Limit
Undrained Triaxial at % Strain at Failure
Penetrometer

Soil Description	ELEV. m	Depth (m)
	127.25	0
~ 76 mm **ASPHALT** and ~ 152 mm **GRANULAR**	~127.2 / ~127.0	
FILL: Clayey silt, trace sand, trace to some gravel, dark stains, grey, moist - petroleum odour, some sand		1
	~125.7	
FILL: Silty clay, trace gravel, trace sand, petroleum odour, grey, moist		2
	~125.0	
SILTY CLAY: trace sand, brown, moist		3
	~124.2	
SILTY CLAY TILL: some sand, trace gravel, brown and grey, moist		4
	~122.7	5
WEATHERD SHALE: trace clay, grey, moist		6
	~121.1	
END OF BOREHOLE		

SPT (N Value): 20 40 60 80
Shear Strength: 100 200 kPa
Combustible Vapour Reading (ppm): 25 50 75
Natural Moisture Content % / Atterberg Limits (% Dry Weight): 10 20 30

SPT values: 15, 5, 6, 13, 16, 50/76mm, 50/51mm

Natural Unit Weight kN/m³: 20.5, 19.7, 21.8

Date	Water Level (m)	Hole Open to (m)
On completion	Dry	0.3
December 2, 2021	1.94	-

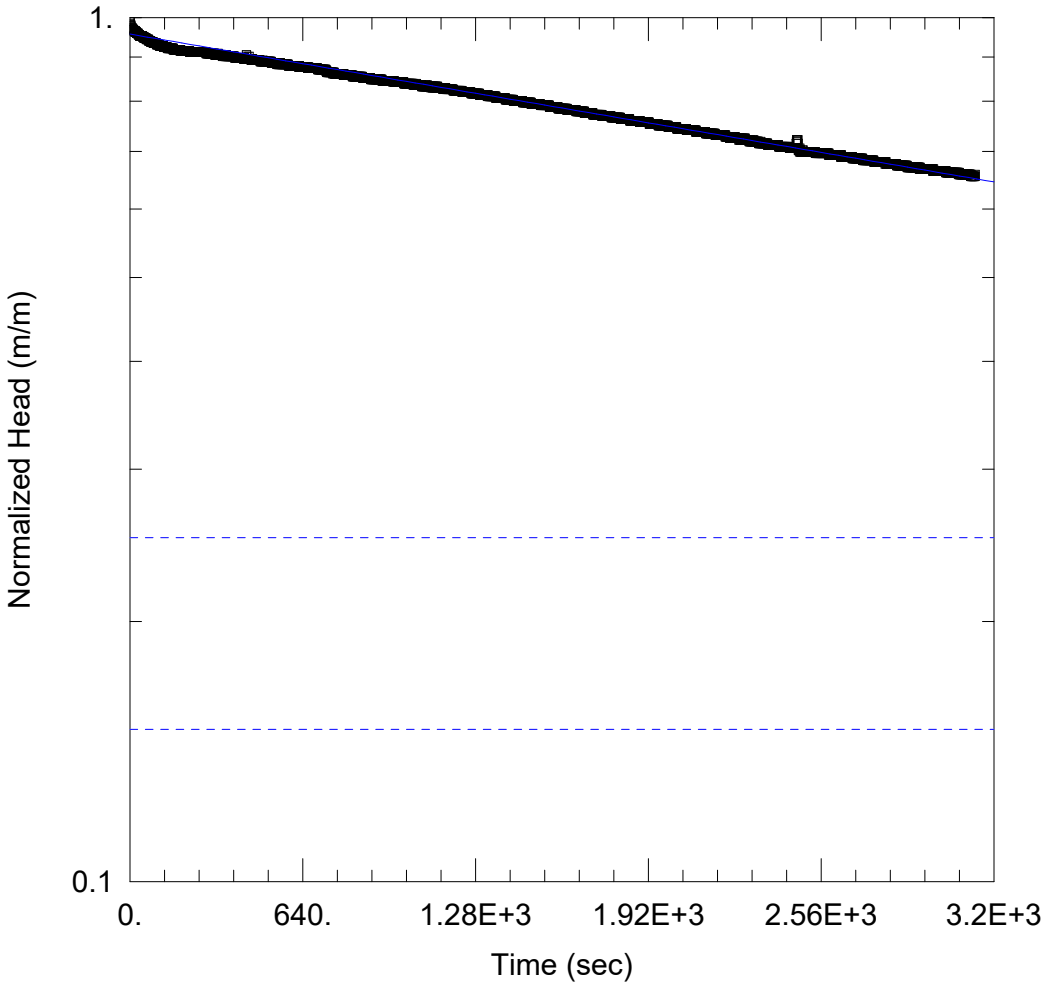
masl - meters above mean sea level

Bold and Red - No representative of statis level

Appendix D – SWRT Procedures and Results



SWRT BH 1 FALLING HEAD TEST

Data Set: C:\...\BH 1.aqt
Date: 12/14/21 Time: 14:54:59

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 1
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 2.723 m Anisotropy Ratio (Kz/Kr): 1.

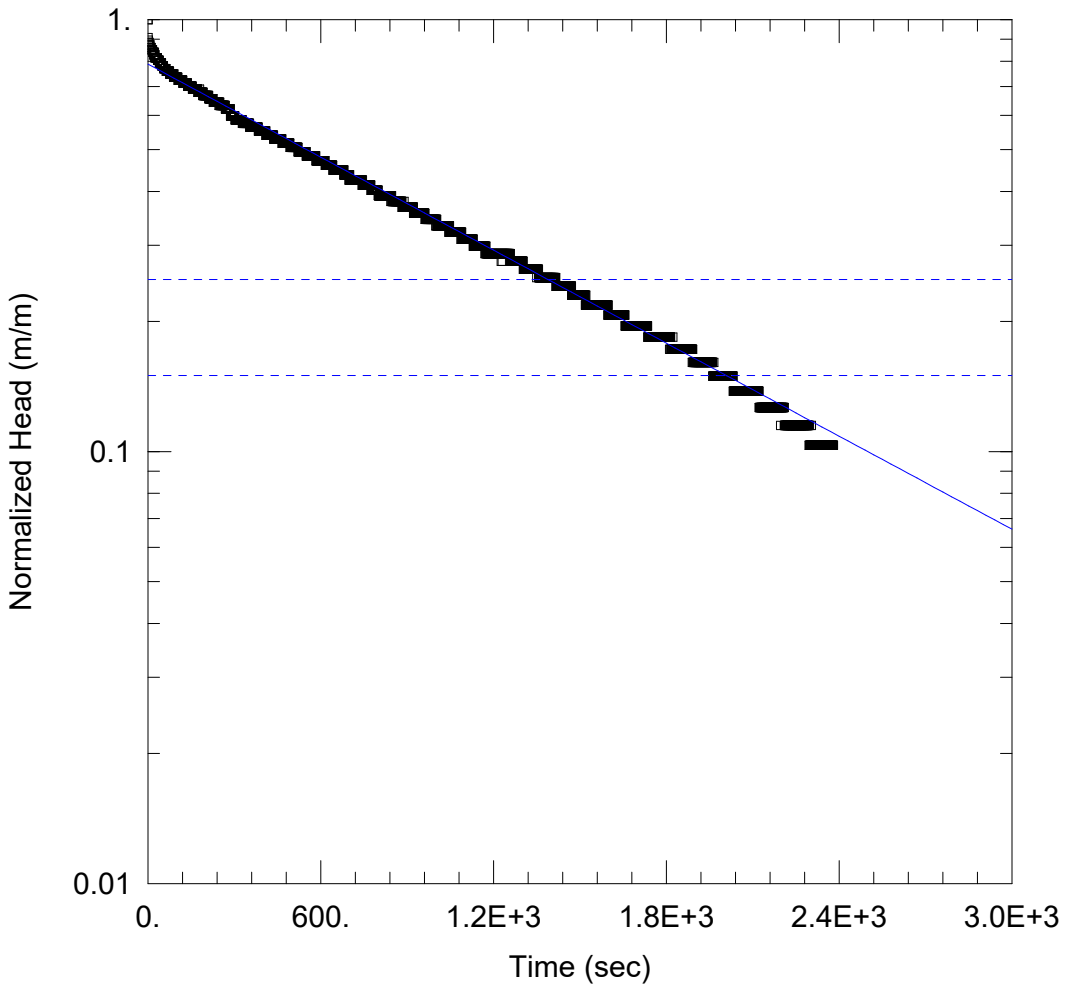
WELL DATA (BH 1)

Initial Displacement: 0.948 m
Total Well Penetration Depth: 3. m
Casing Radius: 0.0254 m
Static Water Column Height: 2.723 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 7.726E-8 m/sec y0 = 0.907 m



SWRT BH 2 - FALLING HEAD

Data Set: C:\...\BH 2 Falling.aqt
Date: 12/14/21 Time: 14:58:51

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 2
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 2.495 m Anisotropy Ratio (Kz/Kr): 1.

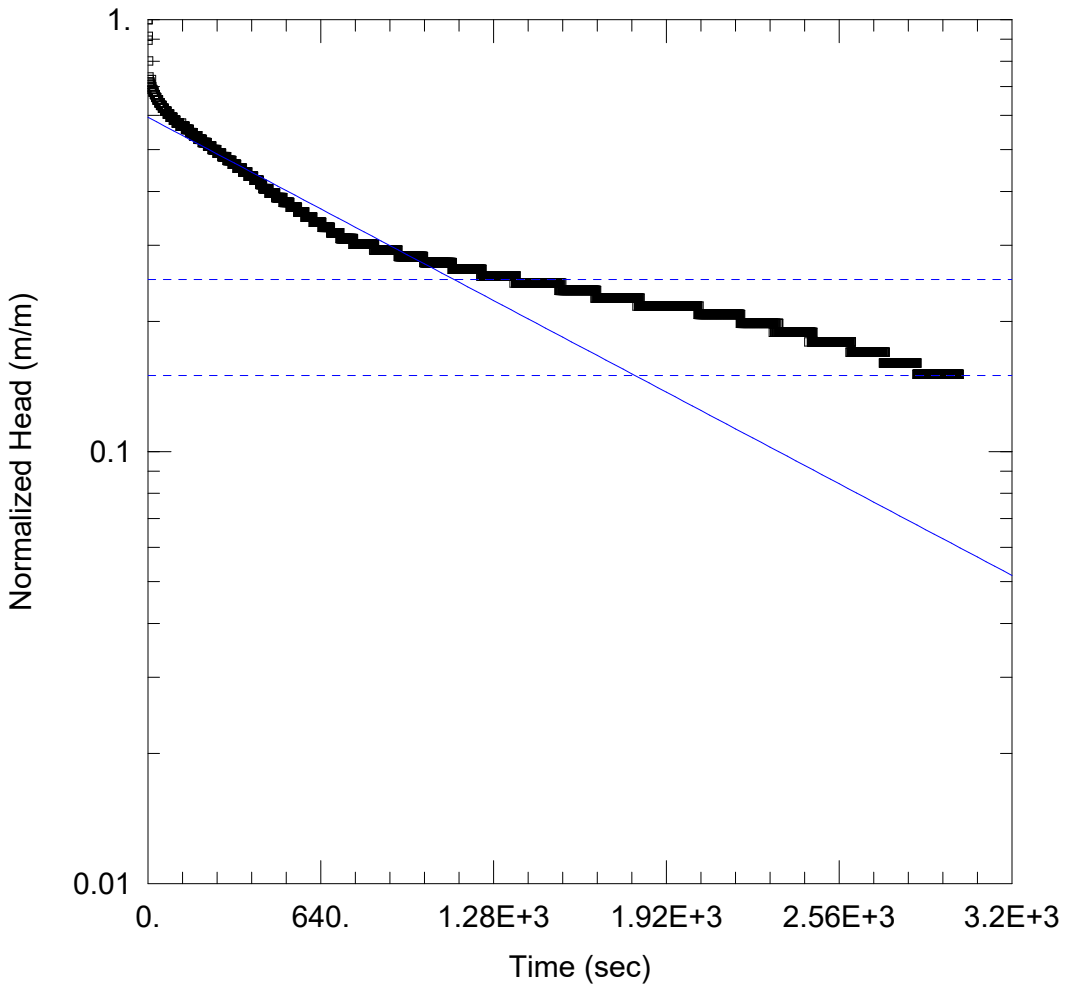
WELL DATA (BH 2)

Initial Displacement: 0.261 m
Total Well Penetration Depth: 3. m
Casing Radius: 0.0254 m
Static Water Column Height: 2.495 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 5.661E-7 m/sec y0 = 0.2058 m



SWRT BH 3 FALLING HEAD

Data Set: C:\...\BH 3.aqt
Date: 12/14/21 Time: 15:03:38

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 3
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 2.511 m Anisotropy Ratio (Kz/Kr): 1.

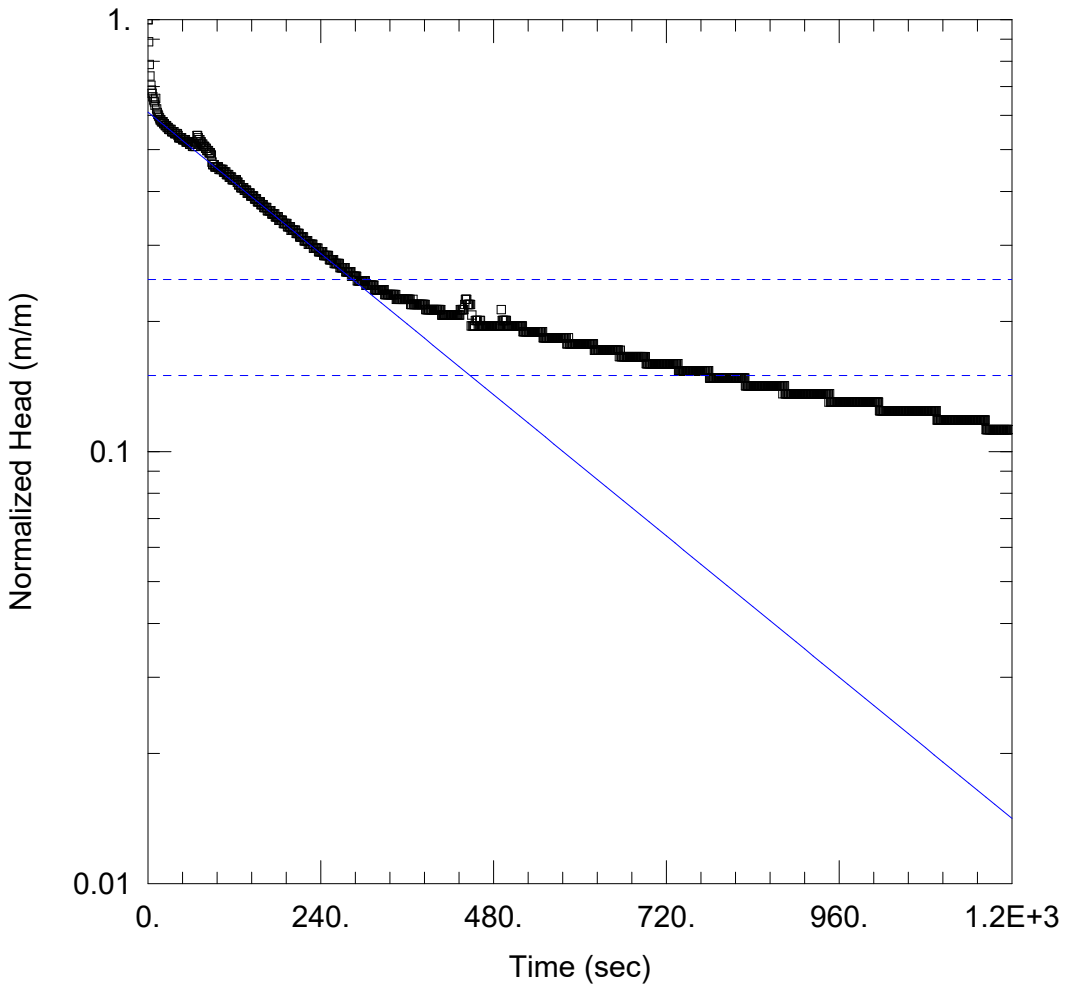
WELL DATA (BH 3)

Initial Displacement: 0.318 m
Total Well Penetration Depth: 3. m
Casing Radius: 0.0254 m
Static Water Column Height: 2.511 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 5.194E-7 m/sec y0 = 0.1889 m



SWRT BH 4 FALLING HEAD

Data Set: C:\...\BH 4 Falling.aqt
Date: 12/14/21 Time: 15:08:29

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 4
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 2.053 m Anisotropy Ratio (Kz/Kr): 1.

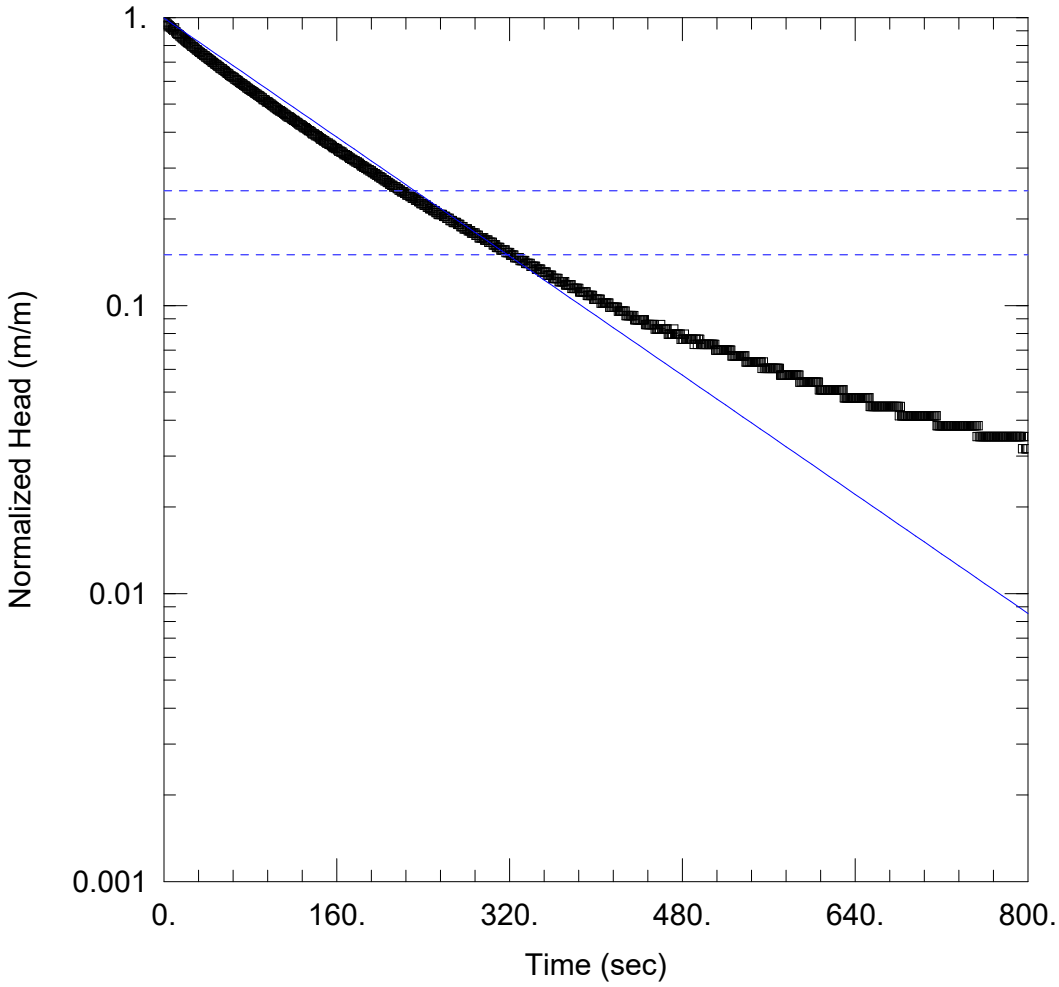
WELL DATA (BH 4)

Initial Displacement: 0.507 m
Total Well Penetration Depth: 3. m
Casing Radius: 0.0254 m
Static Water Column Height: 2.053 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 2.611E-6 m/sec y0 = 0.3093 m



SWRT BH 5 FALLING HEAD

Data Set: C:\...\BH 5.aqt
Date: 12/14/21 Time: 15:11:55

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 5
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 3.123 m Anisotropy Ratio (Kz/Kr): 1.

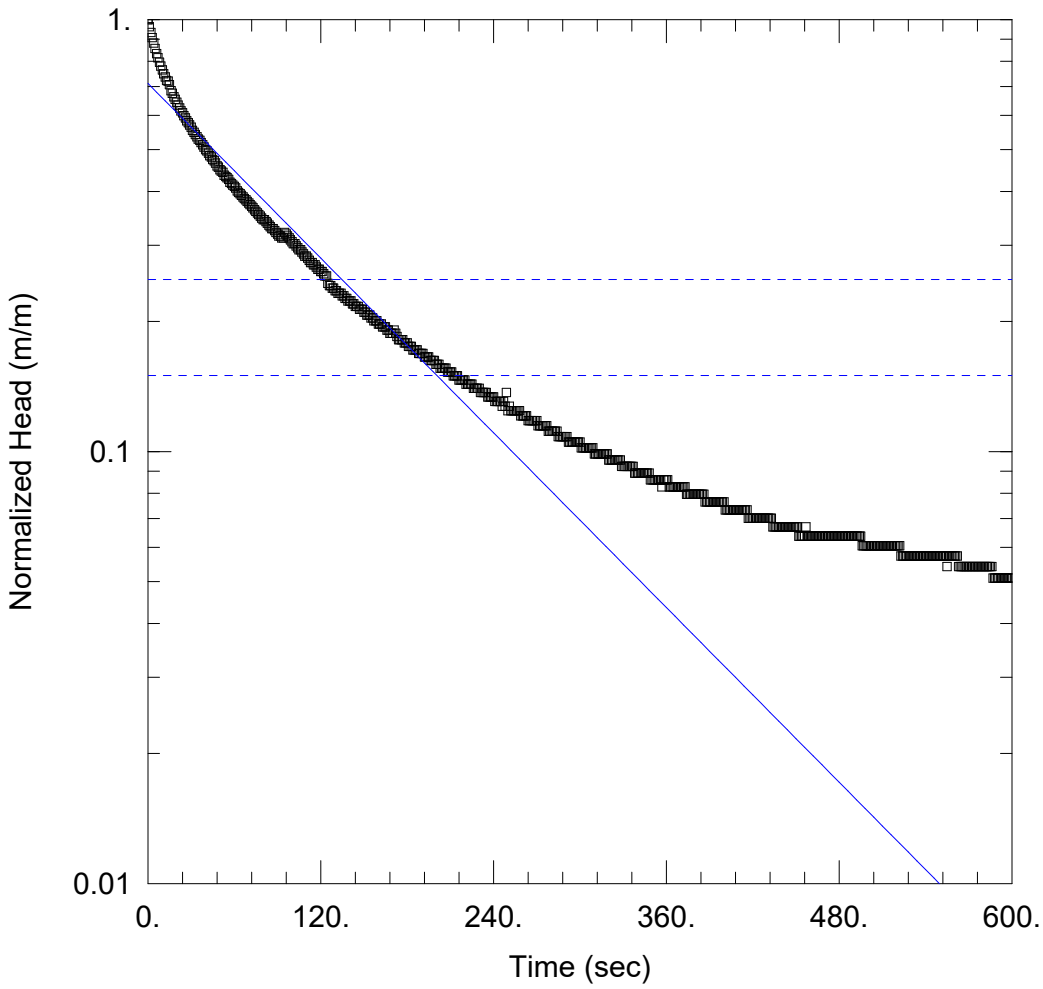
WELL DATA (BH 5)

Initial Displacement: 0.942 m
Total Well Penetration Depth: 3.123 m
Casing Radius: 0.0254 m
Static Water Column Height: 3.123 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 2.794E-6 m/sec y0 = 0.9383 m



SWRT BH 6 FALLING HEAD

Data Set: C:\...\BH 6 Falling.aqt
Date: 12/14/21 Time: 15:16:47

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 6
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 4.192 m Anisotropy Ratio (Kz/Kr): 1.

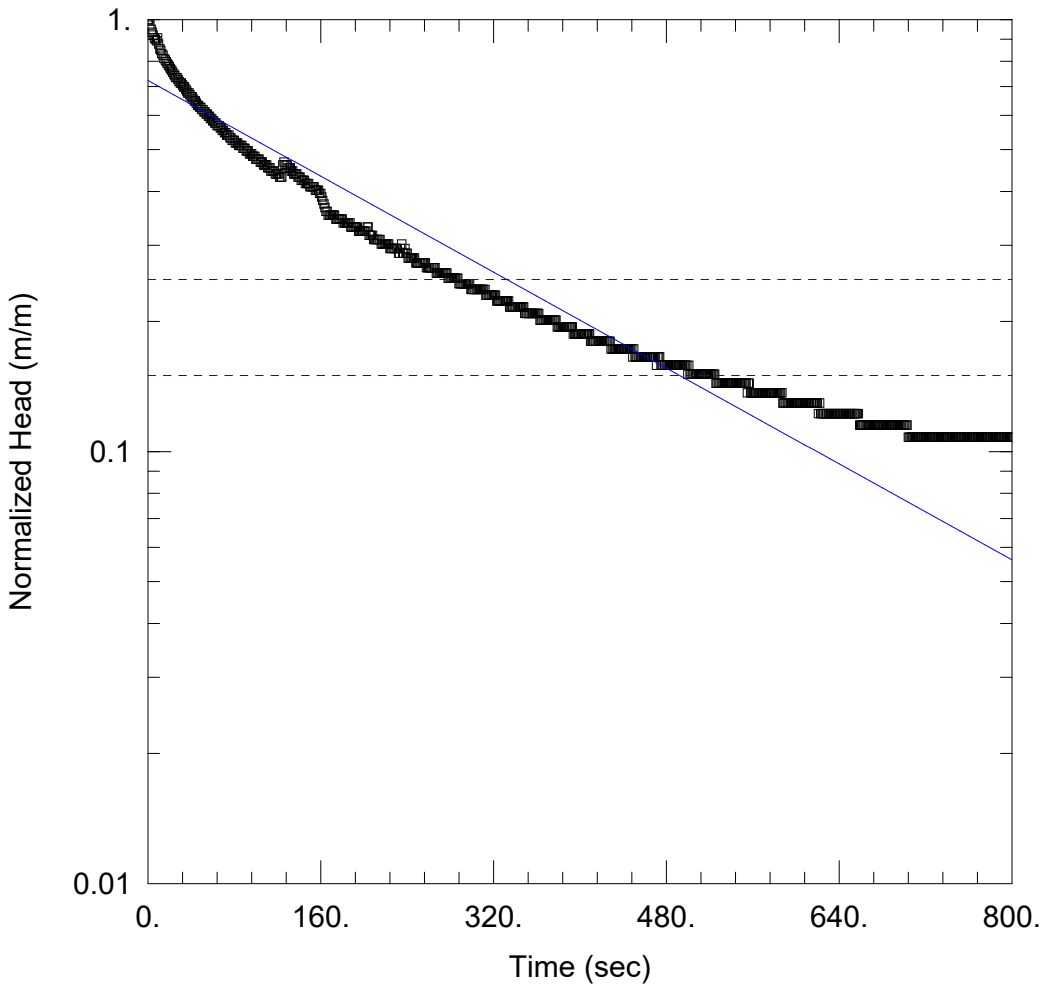
WELL DATA (BH 6)

Initial Displacement: 0.942 m
Total Well Penetration Depth: 4.192 m
Casing Radius: 0.0254 m
Static Water Column Height: 4.192 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 3.643E-6 m/sec y0 = 0.67 m



SWRT BH 7 FALLING HEAD

Data Set: C:\...\BH 7 Falling.aqt
Date: 12/14/21 Time: 15:19:44

PROJECT INFORMATION

Company: EXP Services Inc
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13 John Street, Toronto
Test Well: BH 7
Test Date: December 3, 2021

AQUIFER DATA

Saturated Thickness: 3.198 m Anisotropy Ratio (Kz/Kr): 1.

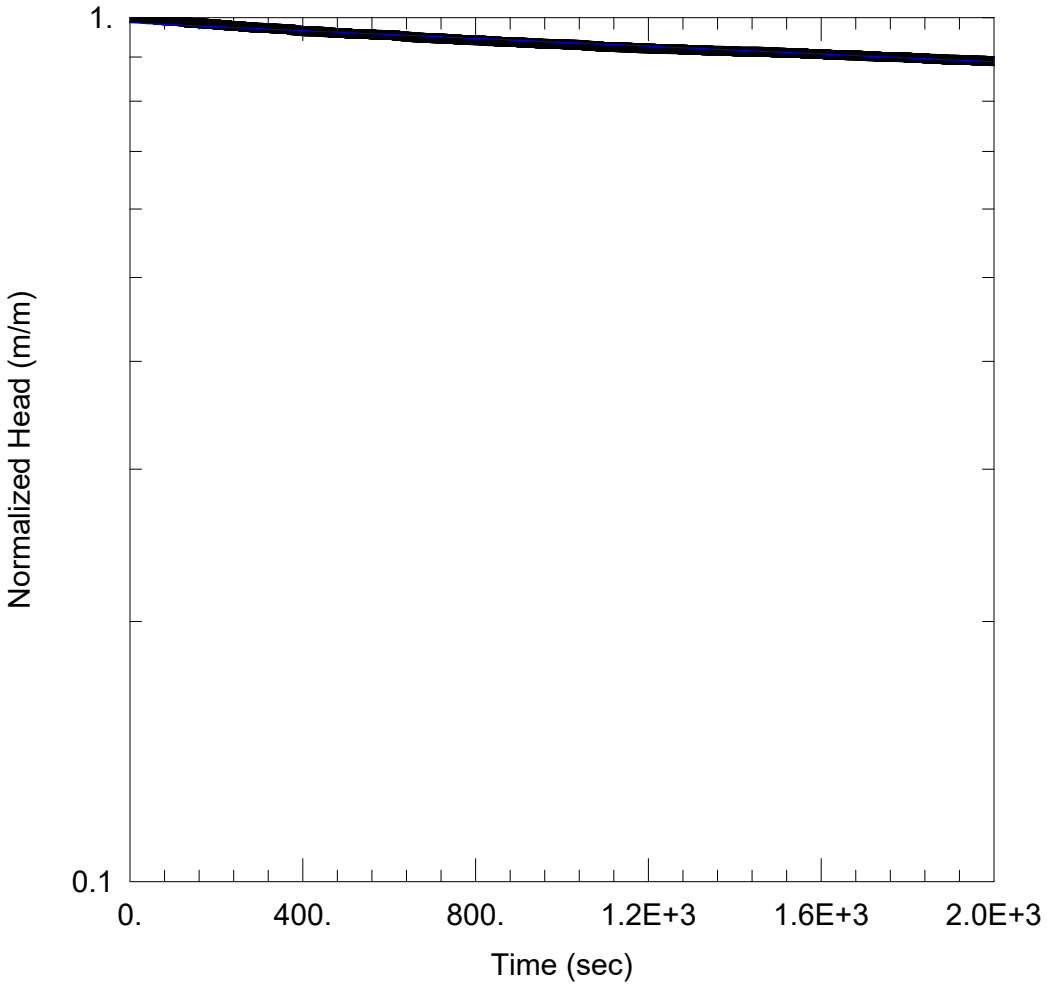
WELL DATA (BH 7)

Initial Displacement: 0.417 m
Total Well Penetration Depth: 3.198 m
Casing Radius: 0.0254 m
Static Water Column Height: 3.198 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 1.5E-6 m/sec y0 = 0.3014 m



BH201 - FALLING HEAD

Data Set: I:\...\BH201.aqt
Date: 08/17/22 Time: 13:00:30

PROJECT INFORMATION

Company: EXP
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13-21 John St, Toronto
Test Well: BH201
Test Date: August 4, 2022

AQUIFER DATA

Saturated Thickness: 4.96 m Anisotropy Ratio (Kz/Kr): 1.

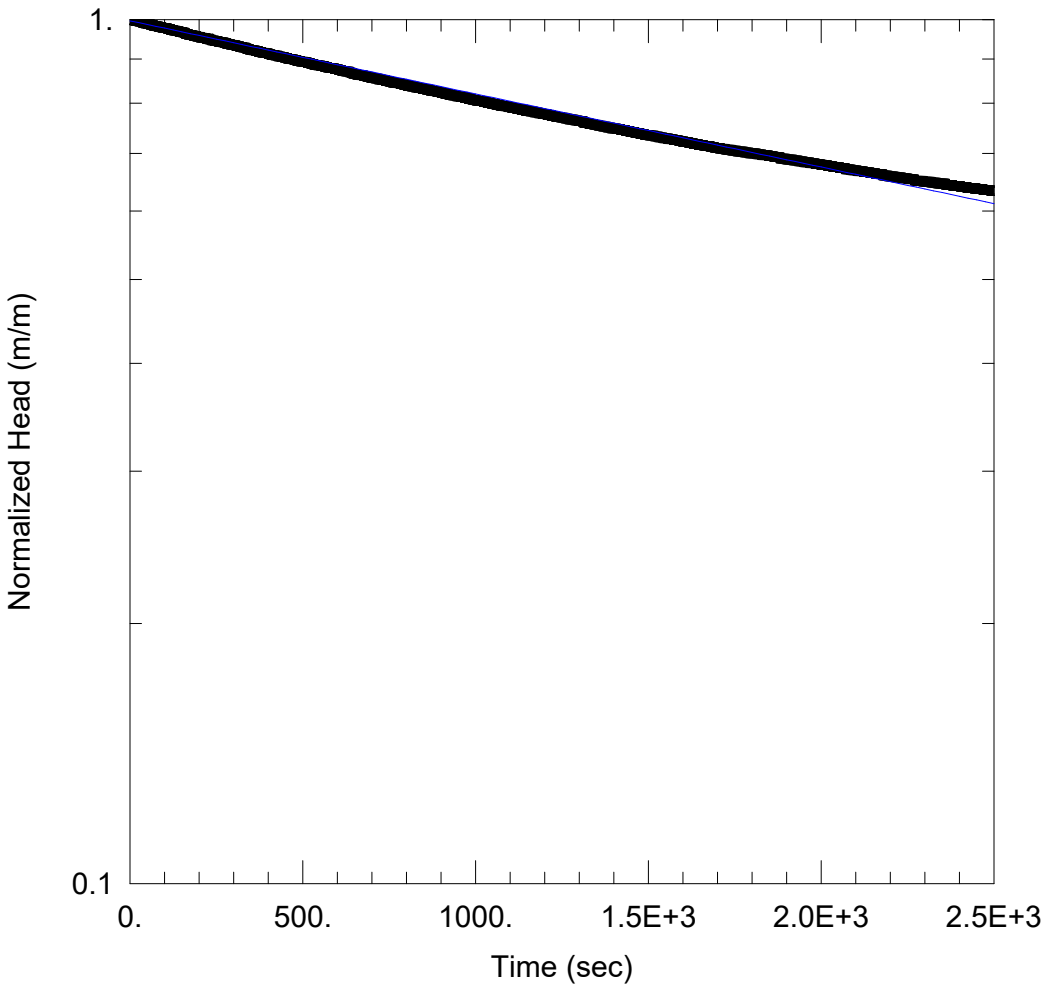
WELL DATA (BH201)

Initial Displacement: 1.548 m
Total Well Penetration Depth: 4.96 m
Casing Radius: 0.0254 m
Static Water Column Height: 4.96 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Confined Solution Method: Hvorslev

K = 2.438E-8 m/sec y0 = 1.526 m



BH202 - FALLING HEAD

Data Set: I:\...\BH202.aqt
Date: 08/17/22 Time: 13:02:44

PROJECT INFORMATION

Company: EXP
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13-21 John St, Toronto
Test Well: BH202
Test Date: August 4, 2022

AQUIFER DATA

Saturated Thickness: 5.01 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH202)

Initial Displacement: 1.668 m
Total Well Penetration Depth: 5.01 m
Casing Radius: 0.0254 m
Static Water Column Height: 5.01 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Confined
Solution Method: Hvorslev
K = 9.148E-8 m/sec
y0 = 1.662 m

Data Set: \...\BH 203_Falling Head.aqt
Date: 08/19/22 Time: 09:29:03

PROJECT INFORMATION

Company: EXP
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13-21 John St, Toronto
Test Well: BH203
Test Date: August 18, 2022

AQUIFER DATA

Saturated Thickness: 6.03 m Anisotropy Ratio (Kz/Kr): 1.

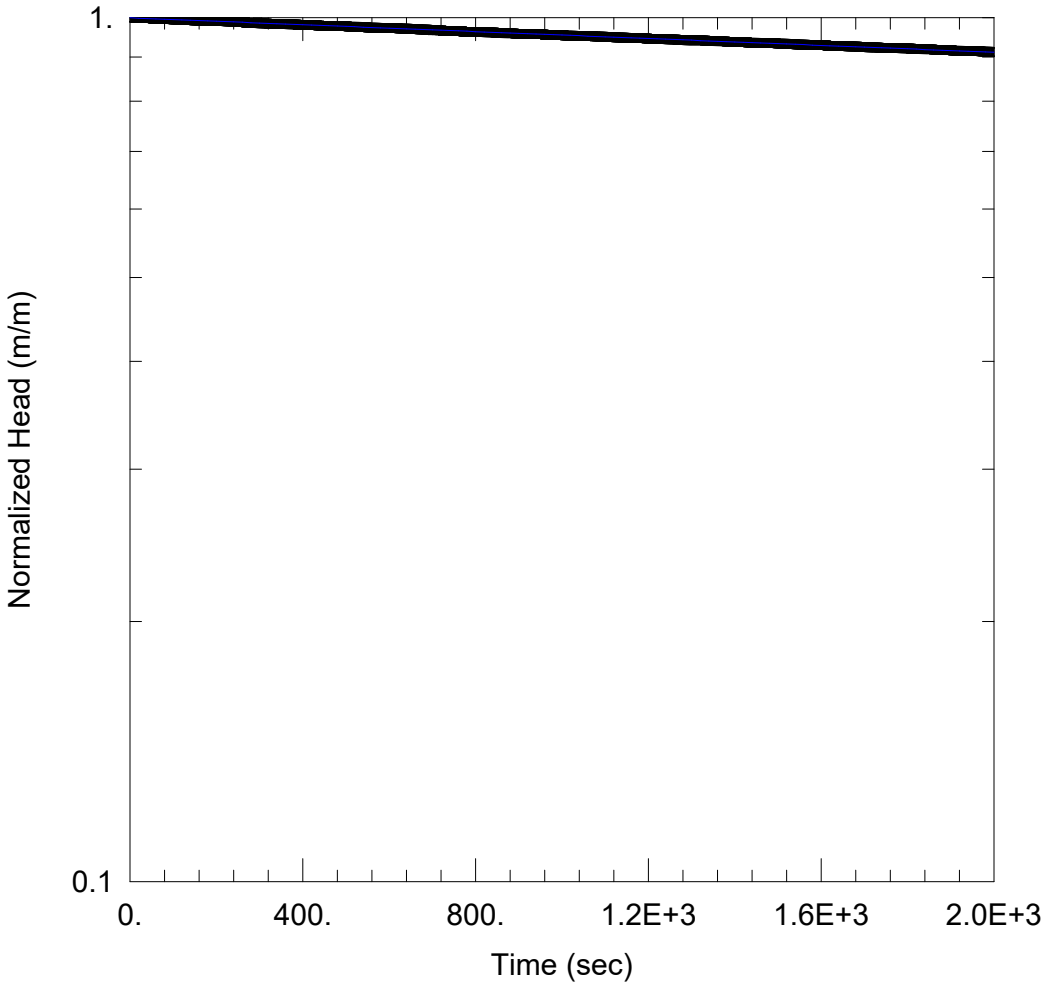
WELL DATA (BH 203)

Initial Displacement: 1.125 m
Total Well Penetration Depth: 6.03 m
Casing Radius: 0.0254 m
Static Water Column Height: 6.03 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Unconfined Solution Method: Hvorslev

K = 3.495E-7 m/sec y0 = 0.9249 m



BH204 - FALLING HEAD

Data Set: I:\...\BH204.aqt
Date: 08/17/22 Time: 13:05:18

PROJECT INFORMATION

Company: EXP
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13-21 John St, Toronto
Test Well: BH204
Test Date: August 4, 2022

AQUIFER DATA

Saturated Thickness: 5.19 m Anisotropy Ratio (Kz/Kr): 1.

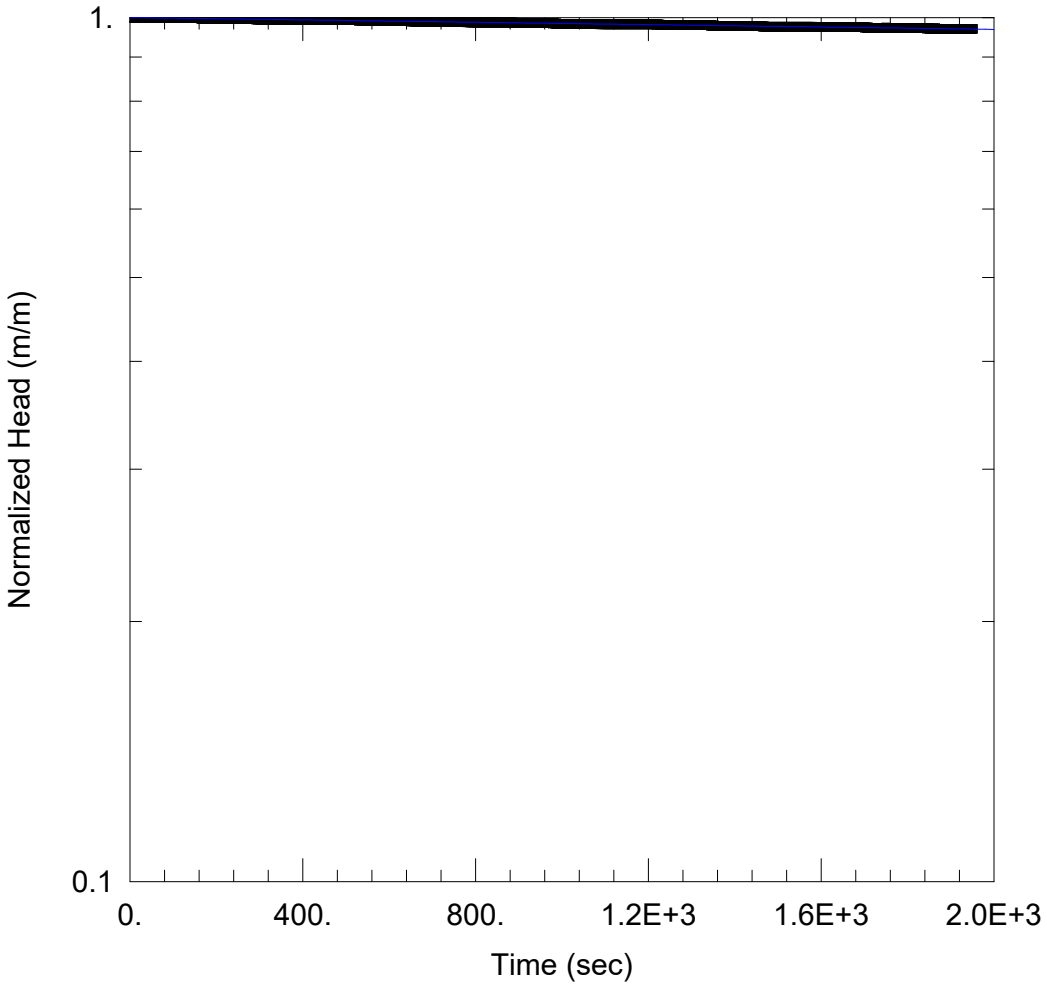
WELL DATA (BH204)

Initial Displacement: 1.531 m
Total Well Penetration Depth: 5.19 m
Casing Radius: 0.0254 m
Static Water Column Height: 5.19 m
Screen Length: 3. m
Well Radius: 0.0762 m

SOLUTION

Aquifer Model: Confined
Solution Method: Hvorslev

K = 1.815E-8 m/sec
y0 = 1.53 m



BH205 - FALLING HEAD

Data Set: I:\...\BH205.aqt
Date: 08/17/22 Time: 13:05:59

PROJECT INFORMATION

Company: EXP
Client: Devron Developments
Project: BRM-21021990-A0
Location: 13-21 John St, Toronto
Test Well: BH205
Test Date: August 4, 2022

AQUIFER DATA

Saturated Thickness: 4.1 m Anisotropy Ratio (Kz/Kr): 1.

WELL DATA (BH205)

Initial Displacement: 1.629 m Static Water Column Height: 4.1 m
Total Well Penetration Depth: 4.1 m Screen Length: 3. m
Casing Radius: 0.0254 m Well Radius: 0.0762 m

SOLUTION

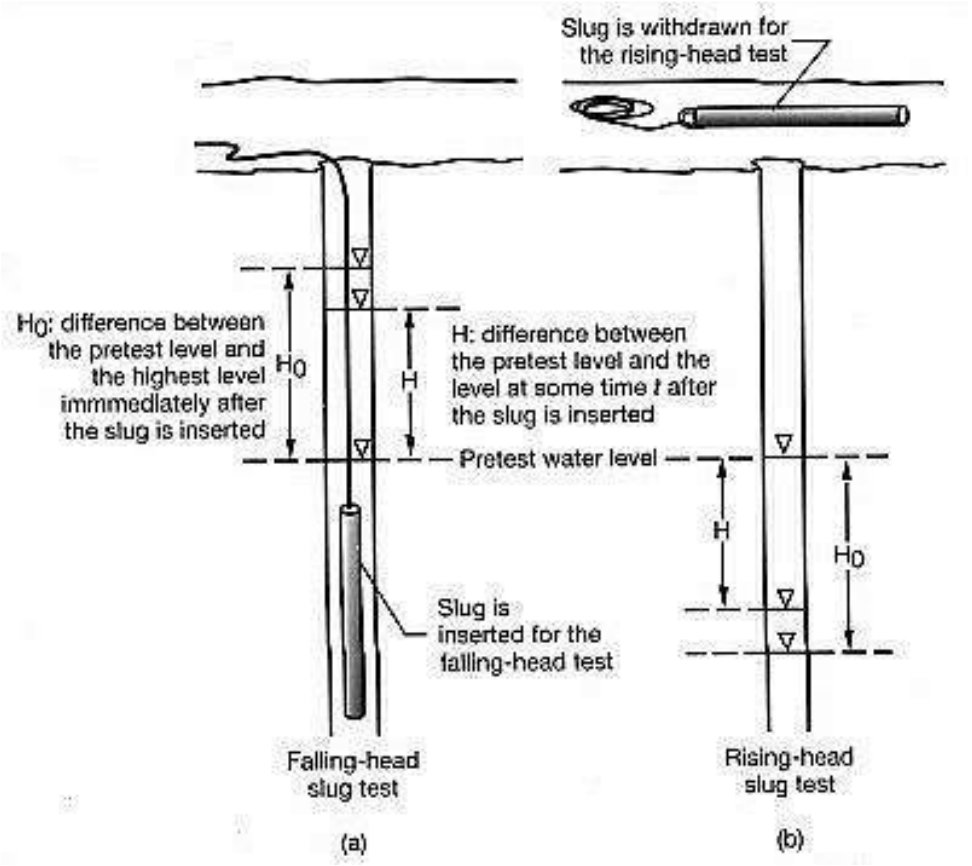
Aquifer Model: Confined Solution Method: Hvorslev
K = 7.419E-9 m/sec y0 = 1.629 m

Single Well Response Test Procedure

A Single Well Response Test (SWRT), also known as a bail test or a slug test, is conducted in order to determine the saturated hydraulic conductivity (K) of an aquifer. The method of the SWRT is to characterize the change of groundwater level in a well or borehole over time.

In order to ensure consistency and repeatability, all **exp** employees are to follow the procedure outlined in this document when conducting SWRTs.

The figure below depicts a schematic of a slug and bail test and the respective water level changes.



Initials ___

Slug Test Procedure

Equipment Required

- Copy of a signed health and safety plan
- Copy of the work program
- PPE as required by Site-Specific HASP
- Copy of the monitoring well location plan/site plan
- Waterproof pen and bound field note book
- SWRT field data Entry form
- Disposable gloves
- Duct tape
- Deionized water
- Alconox (phosphate free detergent)
- Spray bottles
- Electronic water level meter and spare batteries
- Solid PVC or stainless steel slug of known volume or clean water
- String (nylon)
- Water pressure transducer (data logger) and baro-logger
- Watch or stop watch with second hand
- Plastic sheeting

Testing Procedure

1. Remove cap from well and collect static water level
2. Remove waterra tubing/bailer and place in garbage bag. Record static water level measurement again.
3. Lower the slug into the well and record the dynamic water level.
4. Record the drawdown (for the slug test) at set five (5) second intervals for the first five (5) minutes, then reduce to every one (1) minute.
5. Continue recording the drawdown until 95% recovery is reached. To calculate this value: Find the difference between the dynamic water level and the static water level, then multiply by 95% (.95). Add the resulting value to the dynamic water level.

   (Static Water Level – Dynamic Water Level).95 + Static Water Level = 95% Recovery Value
6. Once complete, replace the waterra tubing/bailer and re-secure the well cap.

Note: If the well is deep, more than one slug may be inserted by attaching the slugs to a series.

Slugs must be washed with methanol, then lab grade soap, and then rinsed with de-ionized water after each use.

Based on the recorded observations, the hydraulic conductivity (in m/s) of the aquifer will be determined. In order to determine the hydraulic conductivity; the well diameter, radius of the borehole and length of the screen will also be required.

Bail Test Procedure

Equipment Required

- 20 L (5 gal) Graduated pail
- Stop watch or watch with seconds
- Garbage bags
- Water level meter
- Field sheets/log book
- Latex Gloves
- Bailer and Rope

Procedure

1. Remove cap from well and collect static water level.
2. If using a **bailer**:
    a. Affix the rope to the bailer.
    b. Remove the waterra tubing and place in garbage bag
    c. Record static water level measurement again.
    d. Record how much water was removed by either counting the number of full bailers or emptying removed water into a container.
    e. Quickly lower the bailer into the well and remove.
    f. Continue this process until the water level will reduce no further.
    g. Record the dynamic water level.
3. If using **waterra** to bail the water:
    a. Pump the water into graduated bucket until the water level will reduce no further.
    b. Record how much water has been removed.
    c. Record the dynamic water level.
4. Record the recovery at set five (5) second intervals for the first (5) minutes, then reduce to every one (1) minute.
5. Continue recording the drawdown/recovery until 95% recovery is reached.
6. Once complete, replace any waterra tubing that may have been removed from the well and re-secure the well cap.

GENERAL COMMENTS

Each temperature is the average of up to three cooler temperatures taken at receipt

Package 1	25.7°C

Sample TJA920 [BH 203] : VOC Analysis: Due to the sample matrix, sample required dilution. Detection limits were adjusted accordingly.

Results relate only to the items tested.

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Matrix Spike: A sample to which a known amount of the analyte of interest has been added. Used to evaluate sample matrix interference.

QC Standard: A sample of known concentration prepared by an external agency under stringent conditions. Used as an independent check of method accuracy.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

Surrogate: A pure or isotopically labeled compound whose behavior mirrors the analytes of interest. Used to evaluate extraction efficiency.

NC (Matrix Spike): The recovery in the matrix spike was not calculated. The relative difference between the concentration in the parent sample and the spike amount was too small to permit a reliable recovery calculation (matrix spike concentration was less than the native sample concentration)

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Comments: RDL - Reported Detection Limit; G / S - Guideline / Standard: A Refers to City of Toronto Sanitary and Combined Sewers Discharge, B Refers to CIty of Toronto Storm Sewer Discharge
Guideline values are for general reference only. The guidelines provided may or may not be relevant for the intended use. Refer directly to the applicable standard for regulatory interpretation.

3272934 Oil and Grease animal/vegetable is a calculated parameter. The calculated value is the difference between Total O&G and Mineral O&G.
Total PAHs is calculated as sum of Anthracene, Benzo(a)pyrene, Benzo(a)anthracene, Benzo(b)fluoranthene, Benzo(k)fluoranthene, Benzo(g,h,i)perylene, Chrysene, Dibenz(a,h)anthracene, Fluoranthene, Indeno(1,2,3-cd)pyrene, Perylene, Phenanthrene and Pyrene.

BRM-21021990-A0

Table F-1: Construction and Post-Construction Dewatering Assessment

Parameters	Symbols	Unit	Construction	Post-Construction
Geological Formation	-	-	Glacial Deposit	Glacial Deposit
INPUTS				
Ground Elevation	-	mASL	**127.40**	**127.40**
Highest Groundwater Elevation	-	mASL	**126.84**	**126.84**
Lowest Top Slab Elevation	-	mASL	**121.40**	**121.40**
Lowest Foundation Invert Elevation	-	mASL	**119.90**	**119.90**
Height of Static Water Table Above the Base of the Water-Bearing Zone	**H**	m	15.34	15.34
Dewatering Target Elevation	-	mASL	118.90	120.90
Height of Target Water Level Above the Base of Water-Bearing Zone	**h_w**	m	7.40	9.40
Drawdown	**s**	m	7.94	5.94
Dupuit Check (> 45%)		m	48%	61%
Base of Aquifer / Water Bearing Zone	-	mASL	**111.50**	**111.50**
Hydraulic Conductivity	**K**	m/s	**7.3E-07**	**7.3E-07**
Length of Excavation	-	m	**78.00**	**78.00**
Width of Excavation	-	m	**43.00**	**43.00**
Equivalent Radius (equivalent perimeter)	**r_e**	m	38.52	38.52
Method to Calculate Radius of Influence	-	-	**Cooper-Jacob**	**Cooper-Jacob**
Time (days)			**30.00**	**365.00**
Time (seconds)	**t**	s	2592000	31536000
Specific Yield	**Sy**		**0.09**	**0.09**
OUTPUTS				
Cooper-Jacob's Radius of Influence from Sides of Excavation	**Rcj**	m	27	94
Radius of Influence	**Ro**	m	65	132
Dewatering Flow Rate (unconfined radial flow component)	**Q**	m^3/day	**67**	**24**
Factor of Safety	**fs**	-	2.00	1.50
Dewatering Flow Rate (multiplied by factor of safety)	**Q.fs**	m^3/day	**135**	**35**
Precipitation Event	-	mm/day	15	-
Volume from Precipitation	-	m^3/day	50	-
Total Volume (L/day) Discharge of Groundwater (Construction dewatering) **without Safety Factor** (including precipitation)	-	m^3/day	**118**	**-**
Total Volume (L/day) Discharge of Groundwater (Construction dewatering) **with Safety Factor** (including precipitation)	-	m^3/day	**185**	**-**

Precipitation Event 2 year storm	-	mm/day	57
Volume from Precipitation	-	m^3/event	191
Precipitation Event 100 year storm	-	mm/day	124.4
Volume from Precipitation	-	m^3/event	417

Notes:
mASL - meters above sea level

Analytical Solution for Estimating Radial Flow from an Unconfined Aquifer to a Fully-Penetrating Excavation

$$Q_w = \frac{\pi K(H^2 - h^2)}{Ln\,[\frac{R_o}{r_e}]}$$

(Based on the Dupuit-Forcheimer Equation)

$$r_e = \frac{a+b}{\pi} \qquad R_o = R_{cj} + r_e$$

Where:

Q_w = Flow rate per unit length of excavation (m^3/s)

K = Hydraulic conductivity (m/s)

H = Height of static water table above base of water-bearing zone (m)

h_w = Height of target water level above the base of water-bearing zone (m)

Rcj=Cooper Jacob Radius of Influence (m)

R_o=Radius of influence (m)

re=Equivalent perimeter (m)
